through  
31 March 2011

## ANNUAL PERFORMANCE REPORT

### *District Fisheries Management* Part I

#### Project 1: Lake and Tailwater Fishery Surveys

Project Leader: *Paul Rister*, Western Fishery District Biologist (WFD)  
Assistant Project Leader: *Neal Jackson*, Assistant WFD Biologist

Project Leader: *Robert Rold*, Northwestern Fishery District Biologist (NWFD)  
Assistant Project Leader: *Jeremy Shiflet*, Assistant NWFD Biologist

Project Leader: *Eric Cummins*, Southwestern Fishery District Biologist (SWFD)  
Assistant Project Leader: *David Wyffels*, Assistant SWFD Biologist

Project Leader: *Jeff Crosby*, Central Fishery District Biologist (CFD)  
Assistant Project Leader: *Kathryn Emme*, Assistant CFD Biologist

Project Leader: *Fred Howes*, Northeastern Fishery District Biologist (NEFD)  
Assistant Project Leader: *Tom Timmermann*, Assistant NEFD Biologist

Project Leader: *John Williams*, Southeastern Fishery District Biologist (SEFD)  
Assistant Project Leader: *Marcy Anderson*, Assistant SEFD Biologist

Project Leader: *Kevin Frey*, Eastern Fishery District Biologist (EFD)  
Assistant Project Leader: *John Zeigler*, Assistant EFD Biologist

Department of Fish and Wildlife Resources  
Fisheries Division

## PROJECT TECHNICIANS

*Terry Yarbrough and Kenneth Bucy, Western Fishery District*

*Tim Abney and Michael Kinney, Northwestern Fishery District*

*Mike McCormack and Phillip Matlock, Southwest Fishery District*

*Danny Duvall and Jason McDowell, Central Fishery District*

*Chad Nickell and Kevan Lane, Northwestern Fishery District*

*Danny Parks and Dirk Bradley, Southeastern Fishery District*

*Mark Harless and Jason Russell, Eastern Fishery District*

STATE: Kentucky  
GRANT NUMBER: F-50-33  
GRANT TITLE: District Fisheries Management  
GRANT PERIOD: April 1, 2010 – March 31, 2011

**Project 1: Lake and Tailwater Sampling**

*Project Objective:* To annually manage and conserve the sport fisheries and habitats throughout 221,680 acres of freshwater lakes, tailwaters, and small impoundments within the Commonwealth of Kentucky in order to provide recreational fishing opportunities to the public.

**A. Activity**

Sport fish species were sampled throughout Kentucky using electrofishing, gill netting, trap netting, and other gear to gather biological data in order to best manage the sport fish resources of the Commonwealth. In total over 78 lakes/reservoirs (encompassing approximately 217,498 acres), in addition to 4 major tailwaters (approximately 4,182 acres), were sampled and managed. Otoliths were removed to calculate age/growth from various sport fish species of concern. Other measures were monitored including catch rates, mortality, recruitment, length/weight, water temperature, dissolved oxygen, and other physical limnological data. Creel surveys were conducted on nine sport fisheries including: (1) Barren River Lake; (2) Corinth Lake; (3) Dewey Lake; (4) Greenbo Lake; (5) Herrington Lake; (6) Lake Linville; (7) Laurel River Lake; (8) Ohio River – McAlpine Pool; and (9) Rough River Lake. Data was analyzed and compiled into this annual performance report and will be used to effectively manage and enhance the sport fish resources of Kentucky.

**B. Target Dates for Achievement and Accomplishment**

Planned achievement date: March 31, 2011  
Work accomplished: March 31, 2011

**C. Significant Deviations**

None.

**D. Remarks**

See accompanying report. Upon receipt and acceptance of this annual performance report and the forthcoming SF-425, please close this segment (#33) of F-50.

**E. Costs**

\$ 1,174,823.83

## WESTERN FISHERY DISTRICT

### Project 1: Lake and Tailwater Fishery Surveys

#### FINDINGS

Sampling conditions for each sampling event are listed in Table 1.

#### Kentucky Lake

During May, 1,428 black bass were collected by diurnal electrofishing (120 PPS) from standardized sampling locations on Kentucky Lake. Sampling this year was later than normal due to prolonged flooding. The lake level rose to 363 msl elevation during the scheduled week of sampling. Some sampling was attempted while the water was high, but the results were poor. Sampling resumed one week later while water levels were still high, but not at flood stage. Despite the later sampling, the CPUE of largemouth bass was slightly higher than observed in last year's sample. Largemouth bass comprised almost 98% (121.57 fish/hr) of this catch (Table 2). The samples collected from each of the four embayments were similar, in that a high percentage (> 50%) of each sample was comprised of bass between 9.0 and 13.0 in. One exception was the samples from Sugar Bay and Big Bear also had a high number (~30%) of bass between 5.0 and 7.0 in. An objective in the Kentucky Lake Fish Management Plan (KLFMP) for the largemouth bass population is to maintain a catch rate of at least 24.00 fish/hr that are <8.0 in. The catch rate of largemouth bass <8.0 in was 29.65 fish/hr. The KLFMP objective for largemouth bass  $\geq 15.0$  in is to maintain a catch rate of at least 18.00 fish/hr (Table 3). The catch rate of harvestable-size largemouth bass was 12.43 fish/hr during this year's sample. High numbers of 12.0-14.9 in bass should boost the numbers of harvestable size bass in the next few years.

PSD values were similar at each of the four sampled embayments, and suggest a higher proportion of quality size ( $\geq 12.0$  in) fish over stock size ( $\geq 8.0$  in) (Table 4). The PSD value calculated for all largemouth bass was 60, which falls within the targeted range (PSD, 55-75) suggested in the KLFMP. The calculated  $RSD_{15}$  was 14, which falls below the range reported in the KLFMP ( $RSD_{15}$ , 20-40). This value suggests a lower proportion of preferred ( $\geq 15.0$  in) size bass.

No age data was collected this year. Without age data, age frequency and CPUE of age classes was not calculated. Without this information the bass assessments could not be completed.

During October, 664 black bass were collected by diurnal electrofishing (120 PPS) at three locations that had been previously sampled during the spring. Largemouth bass comprised 88% (83.00 fish/hr) of this catch (Table 5). Samples at each embayment were similar in that there were high catch rates of bass between 10.0 and 14.0 in, and 3.0 to 6.0 in. These results are similar to the spring sample. Length and weight data were recorded from all bass collected to calculate relative weight values. The relative weight value for harvestable size largemouth bass was 92 (Table 6). Length-weight equations for black bass species at Kentucky Lake are:

|                 |                                                                                             |
|-----------------|---------------------------------------------------------------------------------------------|
| Largemouth bass | $\text{Log}_{10}(\text{weight}) = -3.64168 + 3.28902 \times \text{Log}_{10}(\text{length})$ |
| Smallmouth bass | $\text{Log}_{10}(\text{weight}) = -3.70240 + 3.17670 \times \text{Log}_{10}(\text{length})$ |
| Spotted bass    | $\text{Log}_{10}(\text{weight}) = -3.53034 + 3.17843 \times \text{Log}_{10}(\text{length})$ |

Otoliths were collected from largemouth bass up to 9.0 in during the fall sampling. Otoliths were used to age these small bass so that age-0 CPUE and growth could be evaluated. The CPUE of age-0 largemouth bass during the fall sample was 24.25 fish/hr (Table 7). The catch rate for age-0 largemouth bass has continued to decline over the past 4 years. However, the decline is coming down from a super year class that was produced in 2007. This same year class was also measured as a high catch of age-1 bass in 2008. The growth of the age-0 largemouth bass continues to be good. Ideally, the age-0 bass should average at least 5.0 in. This type growth is thought to help increase winter survival.

Trap nets were fished for crappie in Blood River and Jonathan Creek embayments for 79 net-nights (nn) during October and November. This sampling effort yielded 2,489 crappie (31.51 fish/nn), of which 14.33 fish/nn (45%) were white crappie and 17.18 fish/nn (56%) were black crappie (Table 8). The trend of black crappie making

up 80% of the sample was broken this year. The first week of sampling followed a severe storm which left the water a little more turbid than normal at Jonathan Creek. This stained water might have been more conducive to catching white crappie than in previous years when water clarity was greater. One of the management objects in the KLFMP is to maintain a catch rate of crappie (excluding age-0) of 20.00 fish/nn. This years sampling yielded 18.67 fish/nn (Table 9), which is an increase over the three previous years. The samples of white crappie collected from each embayment may have been different because of the water clarity. At Blood River, there was a lower number collected (35% of sample) where water clarity was clearer. The majority of the white crappie ranged from 3.0 to 8.0 in long. At Jonathan Creek where water clarity was reduced following the storm, almost half of the sample was white crappie. Of the white crappie collected, 54% were 3.0 in long.

As part of a three year study, Blood River was stocked for the second time with approximately 70,000 age-0 white crappie (2.0-4.0 in) that were OTC marked prior to stocking. Two samples of 50 crappie were held in floating nets for 24 hours to determine stocking mortality. There was 90% mortality of the white crappie held overnight in these nets. It was also noted during the stocking that numerous crappie were already dead on the truck. It is speculated that warmer than normal water temperatures (65° F) in October could have contributed to the higher mortality. There were 38,600 stocked in 2009, and stocking mortality was lower. The water temperature in October of 2009 was around 59° F. A portion of the small crappie collected in trapnets at Blood River was kept to examine the otoliths for OTC marks. There were 102 age-0 otoliths examined, of which 5 (14%) were found to be from stocked fish. There were 76 age-1 otoliths examined, and no OTC marks were observed.

The crappie population at Kentucky Lake continues to produce a quality fishery; however the number of harvestable size white crappie is declining due to poor year classes observed in 2006-2008. The number of crappie  $\geq 8.0$  in collected in trap nets declined to 8.41 fish/nn following a period of four years where it stabilized around 13.00 fish/nn (Table 9). The number of crappie  $\geq 10.0$  in was also down from the previous year's study, 5.19 and 10.38 fish/nn, respectively. Both of these declines, however, may have been related to sampling conditions in 2010 and its effect on collection of black crappie. The KLFMP objective for crappie is to maintain a catch rate of at least 9.00 fish/nn for crappie  $\geq 8.0$  in, and 3.00 fish/nn for crappie  $\geq 10.0$  in. Because these values would not be obtainable in a few years due to the poor production of age-0 crappie in 2006 – 2008, a reduction in the angler creel from 30 to 20 fish was warranted in 2008. The better recruitment observed in 2009 and 2010 should change this declining trend of harvestable size crappie. However, any increase will not be seen for at least one more year if not two, as the fish in these strong year classes grow. PSD and RSD<sub>10</sub> values are reported in Table 10. Length-weight equations for white and black crappie are listed below.

|               |                                                                                             |
|---------------|---------------------------------------------------------------------------------------------|
| White crappie | $\text{Log}_{10}(\text{weight}) = -3.64063 + 3.30985 \times \text{Log}_{10}(\text{length})$ |
| Black crappie | $\text{Log}_{10}(\text{weight}) = -3.59937 + 3.31605 \times \text{Log}_{10}(\text{length})$ |

Otoliths were not collected this year to make age and growth determinations. Without age data, the age frequencies and catch rates by age groups were estimated based on last year's age data. At this time, the density of adult crappie is down, therefore it is expected that growth rates will continue to be good or increase slightly. Tables 11 and 12 list age frequencies for white and black crappie collected. Almost 93% of the white crappie sample was comprised of age-0 and age-1 fish. The catch of age-1 white crappie was also up from 1.83 fish/nn collected in 2009 to 4.08 fish/nn collected this year. In the 2009 sample, age-1 black crappie comprised only 3% (3.03 fish/nn) of the black crappie collected. In this year's sample, the age-1 black crappie comprised 52% (8.96 fish/nn) of the sample. One of the management objectives is to achieve a minimum catch of age-1 crappie of at least 11.00 fish/nn. This year that value was 13.04 fish/nn, which had been below the objective during the past four years. Despite an increase in the recruitment parameter of the crappie assessment, the overall rating dropped to "fair" (Table 13). This drop was due to the decline in the parameter which rates the catch of crappie  $\geq 8.0$  in.

**Lake Barkley**

Black bass were collected by diurnal electrofishing (120 PPS) from 26 April–17 May 2010 at standardized sampling sites on Lake Barkley. A total of 996 black bass were collected at a rate of 99.60 fish/hr (Table 14). Spotted and smallmouth bass accounted for less than 1% of the total black bass sampled. Largemouth bass had a catch rate of 97.10 fish/hr. This catch rate lies below the 10 year average catch rate of largemouth bass (139.46 fish/hr) at Lake Barkley (Table 15). The CPUE of harvestable and stock size fish is also below the past 10 year's average. Our low catch rates across the board are clearly the result of unusual hydrology in the reservoir during our

sampling period. Sampling began at acceptable lake levels, but lake levels quickly jumped to well above summer pool. Areas that were typically 3-4 feet deep had an addition of 6-8 feet of water. In addition, the water was very muddy in many sampling areas which precluded efficient dipping of black bass. Estimates derived from this spring sampling period should be used with caution.

The PSD value (58) for largemouth bass is lower than in previous years (Table 16). However, this value is near the twenty year average (61) for Lake Barkley, suggesting a better size distribution than in years past. The RSD<sub>15</sub> (23) is just below the twenty year average. The PSD value still met our objective goals (PSD of 55-75) established in the BLFMP. The RSD<sub>15</sub> value met the objective goal of 20-40 as well.

The lake specific assessment score for Lake Barkley has varied between "fair" and "good" since 1999 (Table 17). The score has been "good" since 2006. The 2010 rating of "poor" should be disregarded as this value is due to poor sampling conditions. Assuming favorable sampling conditions in 2011, expect this value to rebound.

Largemouth bass were sampled in October 2010 to collect length-weight data and determine the strength of the 2010 year-class. Seven hundred seventy-two largemouth bass were collected at a catch rate of 118.77 fish/hr (Table 18). The length-weight equation for largemouth bass at Lake Barkley is:

$$\text{Log}_{10}(\text{weight}) = -3.49779 + 3.17389 \times \text{Log}_{10}(\text{length})$$

Very few smallmouth bass and spotted bass were collected during the fall sample and therefore length-weight equations were not calculated. Relative weights for the 2010 data are listed in Table 19 for all size-classes of largemouth bass. These values are at or above the 20 year average. Mean length of the age-0 cohort was higher than in 2009 (6.5 in; Table 20). Previous years have shown consistently strong numbers of age-0 largemouth bass. This year's values are above average as well (46.00 fish/hr) with the majority of these fish greater than 5.0 inches in length (42.00 fish/hr). Since year-class-strength tends to be related to the relative size of age-0 fish during the fall of their first year, the 2010 year-class should contribute well to the population in coming years.

Redear sunfish sampling was attempted in May. However, reservoir elevation was well above summer pool and very few fish were located. The redear sampling was postponed until water level returned to normal. When the water level returned to normal, it was much later than typical sampling time might occur. No further redear sampling was conducted.

Trap nets were fished for crappie in Little River and Donaldson Creek embayments for 80 net-nights from 25 October to 5 November 2010. Two thousand four hundred thirty-seven crappie were collected at a rate of 30.46 fish/nn (Table 21). This sample is much higher than in previous years; 658 and 600 fish/nn in 2008 and 2009, respectively. White crappie accounted for 76% of the total catch, and were collected at a rate of 23.11 fish/nn. Black crappie were collected at a rate of 7.35 fish/nn. In contrast to the previous two years, the CPUE of harvestable-size ( $\geq 10.0$  in) crappie was above the ten year average at 1.79 fish/nn (Table 22). In twenty-three years of sampling, this value has ranged from 0.55-3.37 fish/nn. The CPUE of quality-size ( $\geq 8.0$  in) crappie was 5.24 fish/nn, which is above the management objective (4.00 fish/nn) set in the BLFMP.

In 2010, the PSD (24) and RSD<sub>10</sub> (10) of white crappie were dramatically lower than 2009 values (Table 23). The 20-year average PSD and RSD<sub>10</sub> values of white crappie are 59 and 27, respectively. The PSD (56) and RSD<sub>10</sub> (12) values of black crappie are also lower than in 2009, but exceeded the 20-year average of 55. On the surface, the low PSD and RSD values suggest gloom for the crappie fishing outlook. However, as a measure of the proportion of small fish to larger fish, these values overlook an important aspect of the population in 2010. The low values represent low catch rates of larger fish relative to the higher number of young-of-year fish that were captured. The take home message is that despite higher catch rates of larger fish, a near record catch of young fish pushed the PSD and RSD values down. Expect drastic increases in both values in coming years as the exceptional 2010 year class matures.

The length-weight equations of white and black crappie from Barkley Lake are:

|               |                                                                                             |
|---------------|---------------------------------------------------------------------------------------------|
| White crappie | $\text{Log}_{10}(\text{weight}) = -3.67605 + 3.36604 \times \text{Log}_{10}(\text{length})$ |
| Black crappie | $\text{Log}_{10}(\text{weight}) = -3.56491 + 3.30923 \times \text{Log}_{10}(\text{length})$ |

Three hundred eighteen crappie were collected for age estimation from two embayments on Lake Barkley. Ages ranged from 0-7 years for white crappie and 0-4 years for black crappie (Tables 24 and 25). The majority of fish aged were 1-year-olds reiterating the relative lack of adult fish in the population. Growth continues to be good as crappie reach 10.0 in by age 3. Age frequencies were estimated combining catch data with age and growth data. The catch of black crappie was dominated by age-0 and age-1 fish (Table 26) while older black crappie were rare in our catch. The catch of age-0 white crappie (19.01 fish/mn) comprised 82% of the total catch of white crappie (Table 27).

Assessment of the crappie population yielded a rating of "excellent" at Lake Barkley in 2010 (Table 28). This is the only time a rating of "excellent" has been recorded since 1999. Improvements that contributed to the higher ranking include higher CPUE of age-1 and older crappie, CPUE of age-1 crappie, CPUE of age-0 crappie, CPUE of  $\geq 8.0$  in crappie and excellent growth.

### **Lake Pennyrite**

Electrofishing for all species of sportfish was conducted on 12 April, 2010. One hundred forty-six largemouth bass were captured at a rate of 130.36 fish/hr (Table 29). This value is well below the long term average, but closer to the value that is preferred in the management objectives. The goal is higher catch rates of certain size classes of largemouth bass, but lower overall catch rates. The majority of largemouth bass are still below 15.0 in, but 5 fish over 20.0 in were captured in this year's sample, moving the catch rate of fish over 15.0 in (7.14 fish/hr) above any value previously recorded (Table 30). Only 5 percent of the bluegill captured were above 8.0 inches in length, despite a higher overall catch rate (131.25 fish/hr; Table 31). Catch rates for most size classes of bluegill are at or near the long-term average, suggesting a stable population of bluegill. Only thirty-four redear sunfish were captured at a rate of 30.36 fish/hr, but over half of those fish were larger than 8.0 inches in length (Table 29). Overall, catch rates for redear sunfish are well below average for all size classes (Table 31). Table 32 shows PSD and RSD values for largemouth bass, bluegill, and redear sunfish.

### **Lake Beshear**

Largemouth bass were collected by diurnal electrofishing during May at Lake Beshear. A total of 248 largemouth bass were collected at a rate of 82.67 fish/hr (Table 33). The catch rate of harvestable-size ( $\geq 12.0$  in) largemouth bass was 51.00 fish/hr. One objective in the Lake Beshear Fish Management Plan (LBFMP) is to maintain a catch rate of 40.00 fish/hr for harvestable-size largemouth bass. Lower catch rates observed in previous years appear to be a factor of poor sampling conditions rather than a declining fishery. Other objectives are to maintain a high catch rate of bass  $\geq 15.0$  and  $\geq 20.0$  in (Table 34). Ideally, these catch rates should be greater than 30.00 and 4.00 fish/hr, respectively. The catch rate for the number of largemouth bass  $\geq 15.0$  in was 39.67 fish/hr, while the catch rate for the larger ( $\geq 20.0$  in) bass was 3.67 fish/hr. Lake Beshear continues to have a quality bass fishery with high numbers of bass  $\geq 15.0$  in.

Largemouth bass were collected by diurnal electrofishing in October. The catch rate (95.60 fish/hr) was higher than that of the spring sample (Table 33). As would be expected, there was a higher catch rate of smaller bass ( $< 8.0$  in) during the fall sample as compared to the spring sample. Roughly 60% of the fall sample was comprised of these smaller bass. There were also fewer larger fish collected in the fall. This would be expected since adult bass are more concentrated along the shoreline in May in preparation for spawning activity. Relative weight data suggests that the larger bass ( $\geq 15.0$  in) are healthy with regard to their length-weight ratio. The average relative weight value was 95 for these larger bass and 92 for all sizes of bass. The length-weight equation for largemouth bass at Lake Beshear is:

$$\text{Log}_{10}(\text{weight}) = -3.78742 + 3.41712 \times \text{Log}_{10}(\text{length})$$

Otoliths were removed from a sub sample of largemouth bass  $\leq 8.0$  in to determine the mean fall length of the age-0 cohort and their catch rate. The catch rate for this year class was 54.00 fish/hr (Table 35). The average length of the age-0 bass was 4.9 in. Spring flooding likely contributed to the strong success of this year class and above average growth.

### **Lake Blythe**

Lake Blythe is an 89 acre watershed lake located just north of Hopkinsville off Highway 41 in Christian County, Kentucky. The fishery in this lake is primarily largemouth bass, bluegill, redear, crappie and catfish. In recent years sampling has revealed a stunted bass population. Due to repairs to the levee, this lake was partially drained; therefore no boat access was available. This lake was not sampled in 2010.

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body | Location      | Species    | Date           | Time (hr) | Gear           | Weather         | Water temp. °F | Water level | Secchi (ft) | Water Conditions | Pertinent sampling comments                                                                   |
|------------|---------------|------------|----------------|-----------|----------------|-----------------|----------------|-------------|-------------|------------------|-----------------------------------------------------------------------------------------------|

Data from 1985 to 1998 is listed in previous years reports.

<sup>A</sup> age and growth data was not collected. Previous year's data used for age estimates. Since age data had not been collected in 5 years, the estimates based on age were not calculated.

Rating

- 5-7 = Poor (P)
- 8-11 = Fair (F)
- 12-16 = Good (G)
- 17-20 = Excellent (E)

<sup>A</sup> Data collected by fall (October) diurnal electrofishing. Mean lengths were determined by analysis of otoliths removed from a subsample of LMB <8.0 in and extrapolated to the entire catch of the fall sample.

<sup>B</sup> Data from diurnal electrofishing samples collected the following spring (April/May).

<sup>C</sup> Age data was not collected, this is an estimate based off previous years age data.

Data from 1990 to 1999 is listed in previous years reports.

<sup>A</sup> Data collected by fall (October) diurnal electrofishing. Mean lengths were determined by analysis of otoliths, removed from a subsample of LMB <8.0 in.

<sup>B</sup> Data collected during the following spring (April/May) diurnal electrofishing sample.

\* Data will be collected during the spring, diurnal electrofishing sample of 2008.

Table 34. Lake specific assessment for largemouth bass collected at Lake Beshear from 2000 - 2010. This table includes the parameter estimates and the individual score as well as the total score and assessment rating. The final two columns list the instantaneous mortality (Z) and annual mortality (A).

Lake Beshear Bass Data Base

Table 35. Age-0 CPUE (fish/hr) and mean length (in) of largemouth bass collected in the fall, and CPUE of age-1 largemouth bass collected the following spring during diurnal electrofishing at Lake Beshear.

| Year-class | Age-0 <sup>A</sup> |         | Age-0 <sup>A</sup> |         | Age-0 >5.0 in <sup>A</sup> |         | Age-1 <sup>B</sup> |         |
|------------|--------------------|---------|--------------------|---------|----------------------------|---------|--------------------|---------|
|            | Mean length        | Std Err | CPUE               | Std Err | CPUE                       | Std Err | CPUE               | Std Err |
| 2001       | 4.5                | 0.2     | 4.40               | 1.60    | 0.80                       | 0.49    | 15.00              | 2.94    |
| 2002       | 4.2                | 0.2     | 5.00               | 1.29    | 0.00                       |         | 13.50              | 1.33    |
| 2003       | 3.3                | 0.1     | 24.00              | 4.76    | 0.50                       | 0.5     | 4.32               | 1.94    |
| 2004       | 3.8                | 0.1     | 17.60              | 4.12    | 0.00                       |         | 38.80              | 1.80    |
| 2005       | 4.4                | 0.1     | 21.00              | 7.68    | 0.00                       |         | 37.04              | 9.50    |
| 2006       | 4.2                | 0.1     | 23.00              | 7.51    | 3.00                       | 1.91    | 25.00              | 4.24    |
| 2007       | 4.8                | 0.1     | 21.60              | 3.49    | 9.60                       | 2.32    | 10.00              | 1.42    |
| 2008       | 4.3                | 0.1     | 12.40              | 1.17    | 2.00                       | 0.89    | 4.80               | 1.59    |
| 2009       | 3.6                | 0.1     | 24.80              | 5.31    | 2.00                       | 0.63    | 22.33              | 4.90    |
| 2010       | 4.9                | 0.1     | 54.00              | 4.60    | 22.00                      | 4.52    |                    |         |

<sup>A</sup> Data collected by fall (October) diurnal electrofishing. Mean lengths were determined by analysis of otoliths, removed from a subsample of LMB <8.0 in, which were extrapolated to the entire catch of the fall sample, and length frequencies.

<sup>B</sup> Data collected during the following spring (April/May) diurnal electrofishing sample.

WFDWRLB.Dxx, WFDWRAGB.Dxx, WFDPSDLB.Dxx

## NORTHWESTERN FISHERY DISTRICT

### Project 1: Lake and Tailwater Fishery Surveys

#### FINDINGS

Table 1 presents a summary of conditions encountered while sampling at state-owned lakes and ACOE reservoirs during the 2010 field season.

##### **Nolin River Lake**

###### Black Bass Sampling

Spring electrofishing to monitor the black bass population at Nolin River Lake could not be conducted in 2010 due to the high lake level throughout the sampling period.

Fall electrofishing to determine CPUE and mean length of age 0 largemouth bass (Tables 2-3) was conducted in October 2010. Mean length of age 0 largemouth bass and CPUE of age 0 largemouth  $\geq 5.0$  in both increased when compared to the last several years.

###### Crappie Sampling

Trap netting was conducted during October 2010 to assess Nolin River Lake's crappie population (Tables 4-6). A total of 798 crappie (16.9% black) were collected during 79 net-nights of effort (10.10 crappie/net-night). Catch rates in 2010 decreased substantially from 2009 due mostly to the decrease in age 1 fish. Catch rates in 2009 were above normal due to an abundance of age 1 fish from an exceptional 2008 year class. The strong 2008 year class did not result in an expected increase in the catch rate of crappie  $\geq 8.0$  in during sampling in 2010. The length-weight equation is  $\log W = -3.60 + 3.27 (\log L)$ . The objective in the Nolin Lake SMP for a CPUE of  $\geq 8.0$  in fish of  $\geq 7.00$  fish/nn for white crappie was met in 2010. Black crappie age data was collected in 2010 for the first time and is presented in Table 6a.

##### **Rough River Lake**

###### Black Bass Sampling

Spring electrofishing to assess the black bass population at Rough River Lake could not be completed in 2010 due to high water level throughout the sampling time frame.

Fall sampling for mean length and CPUE of age 0 fish was conducted during October (Tables 7-8). Mean length and CPUE of age 0 fish are similar to previous collections.

###### Crappie Sampling

Trap netting to evaluate Rough River Lake's crappie population was conducted the first week of November (Tables 9-11). The catch rate for crappie in 2010 decreased substantially from the 2009 catch rate; however 2009 was an exceptional year. The increased catch rate in 2009 was due to very successful year classes in 2008 and 2009. Age data collected during 2009 indicate mean length at age 1 decreased 1.2 in from when last collected in 2006. The decrease in mean length at age 1 is presumably due to competition from the increased number of small crappie. The log 10 length weight equation is  $\log W = -3.80 + 3.46 (\log L)$ . Rough River Lake SMP objectives for white crappie management state: a CPUE of  $\geq 10.0$  fish/nn (excluding age 0 fish), a CPUE of  $\geq 7.00$  fish/nn for age 1 fish, a CPUE of  $\geq 3.00$  fish/nn for age 0 fish, a CPUE of  $\geq 6.00$  fish/nn for white crappie  $\geq 8.0$  in. The only objective met in 2010 was the CPUE (excluding age 0) of greater than 10.00 fish/nn. Black crappie age data was collected from Rough River Lake for the first time in 2010. Results are presented in Table 11a.

### Hybrid Striped Bass Sampling

Gill netting to assess hybrid striped bass population parameters was conducted the third week of November (Tables 12-16). Catch rates in 2010 were much greater than in any previous survey. Growth rate and age and length distributions were similar to prior collections. This is a very stable population with good growth rates. With the exception of the higher CPUE in 2010, population assessment values have fluctuated little since 1999. The log 10 length weight equation is  $\log W = -3.52 + 3.14 (\log L)$ . Rough River Lake SMP management objectives state: a mean length at capture of  $\geq 16.5$  in for age 2+ fish, a CPUE (excluding age 0 fish) of  $\geq 25.00$  fish/nn, a CPUE of  $\geq 15.00$  fish/nn for  $\geq 15.0$  in fish, and a CPUE of  $\geq 8.00$  fish/nn for age 1 fish. All management objectives were met in 2010.

### Channel Catfish Sampling

The channel catfish population was sampled the third week of November in conjunction with hybrid striped bass sampling (Tables 17-19). Catch rate and length distribution are similar to when the population was first sampled in 2008. Growth rate is good and similar to rates observed at other district lakes.

### Creel Survey

A random, stratified, roving creel survey was conducted at Rough River Lake from April 01 – October 31 2010 to determine angler pressure and catch/harvest statistics (Tables 20-25). The lake was divided into 2 areas (North Fork and South Fork) each with equal pressure probabilities. Days were divided into 2 time periods (morning and afternoon) six hours in length each with equal probabilities. Weekend day probabilities were 2.5x those of weekdays. Each area (North Fork/South Fork) was divided into 3 “sub-areas” of approximately equal size in which the clerk would spend 2.0 hours of the six hour time period (counting and interviewing) before moving to the next sub-area.

Total pressure, catch, and harvest statistics decreased somewhat in 2010, but are similar to results obtained in 2005 when Rough River Lake was last surveyed. Black bass was the most sought after species group in 2010 with 43,911 man-hours of pressure followed closely by the crappie group at 41,330 man-hours. In 2005, the crappie group and black bass group were nearly equal with crappie receiving 56,606 man-hours and black bass 51,009 man-hours. Man-hours spent in pursuit of “anything” decreased from 27,449 man-hours in 2005 to 18,309 in 2010. Angling pressure directed toward panfish decreased from 16,786 man-hours in 2005 to 9,469 man-hours in 2010 and hybrid striped bass pressure decreased from 19,643 man-hours in 2005 to 8,288 man-hours in 2010. Catfish angling pressure estimates were nearly equal for both surveys. Some of the decline observed in angler pressure may be attributed to an unusually hot and dry summer period. Rough River Lake surface temperatures were in the low 90's for several weeks during July and August.

The estimated 31,840 largemouth caught in 2010 is a decrease from the 49,336 caught in 2005, however estimated harvest was nearly equal for both surveys (5,480 in 2010 vs. 5,909 in 2005). Mean length of harvested fish was also similar at 14.4 inches in 2010 and 14.9 inches in 2005. In 2010, an estimated 136,221 white crappie were caught and 43,737 harvested which is a significant increase from the 49,001 caught and 19,841 harvested in 2005. Mean length of harvested white crappie decreased from 10.4 inches in 2005 to 9.5 inches in 2010. The increase in the number of crappie caught/harvested in 2010 and the decrease in mean length of harvested white crappie in 2010 is from an abundance of 4.0-6.0 in white crappie in the population due to extremely successful year classes in 2008 and 2009. Even though the hybrid striped bass angling pressure decreased from 19,643 man-hours in 2005 to 8,288 man-hours in 2010, the estimated 6,184 hybrid striped bass caught and 3,504 harvested is very similar to estimates obtained during the 2005 creel survey.

An angler attitude survey was conducted in conjunction with the creel survey (Figure 1). Overall, anglers were mostly satisfied with their fishing experiences at Rough River Lake.

## Lake Malone

### Largemouth Bass Sampling

Electrofishing data for the largemouth bass population assessment was collected during April 2010 (Tables 26-32). The increase in the total catch rate in 2010 is due primarily to increases in the catch rates of 8.0-12.0 in and  $\geq 15.0$  in bass. Catch rates in 2009 were below normal and the 2010 CPUE is similar to previous collections. Age data collected in 2010 indicate growth rate has improved slightly from when last collected in 2007, but is still somewhat slower than in the early 2000's. Lake Malone was not fertilized in 2010 for the first time in approximately 30 years. Growth rates documented in 2010 will be compared to future growth rates to document any effects of discontinuing the fertilization program. Lake Malone was again electrofished in October for relative weight and mean length and CPUE of age 0 fish (Tables 33-34). The mean length of age 0 bass is similar to previous years. The CPUE of age 0 bass and CPUE of age 0 bass  $\geq 5.0$  in are greater than most prior collections. Lake Malone SMP objectives for management of largemouth bass state: a mean length age 3 at capture of  $\geq 12.0$  in, a CPUE of  $\geq 20.00$  fish/hr for age 1 fish, a CPUE of  $\geq 35.00$  fish/hr for 12.0-14.9 in fish, a CPUE of  $\geq 40.00$  fish/hr for  $\geq 15.0$  in fish, and a CPUE of  $\geq 6.00$  fish/hr for  $\geq 20.0$  in fish. The only objectives met in 2010 were the catch rates of the 12.0-14.9 in and  $\geq 15.0$  in fish.

### Bluegill/Redear Sunfish Sampling

Electrofishing to determine bluegill and redear sunfish population statistics at Lake Malone was conducted during May 2010 (Tables 35-38). The 2010 catch rate is the highest ever collected and follows a decade long trend of increasing total CPUE due to the increasing catch rate of 3.0-5.0 in bluegill. The Lake Malone SMP objectives for bluegill management state a CPUE of  $\geq 50.00$  fish/hr for  $\geq 6.0$  in fish, and a CPUE of at least 1.00 fish/hr for  $\geq 8.0$  in fish. The objective for CPUE of  $\geq 8.0$  in fish was not met.

### Channel Catfish Sampling

To assess the current annual stocking rate of 25 fish/acre, channel catfish were sampled with tandem hoop net sets in October to determine length distribution and growth rate (Tables 39-40). Six tandem hoop net sets (3 nets in series) were fished for 3 days the second week of October. Growth rates are fair and the population is comprised of primarily ages 1-4 with a few fish in the age 5-8 range. Lake Malone will not be stocked in 2011 and then stocked at a reduced rate beginning in 2012 in an effort to increase growth.

## Mauzy Lake

Mauzy Lake was drawn down in October 2008 to replace the leaking water control structure. The lake remained 6-10 feet below normal pool until September-October 2009 when it was lowered to 13 feet below normal pool to replace the structure. Repair work was completed in November 2009 and the lake reached full pool in May 2010. Low water level prevented sampling in 2009.

### Largemouth Bass Sampling

Electrofishing to assess the largemouth bass population at Mauzy was conducted in April (Tables 28, 41-43). The total catch rate in 2010 for largemouth bass at Mauzy was lower than the past few surveys, due mostly to a reduction in the number of largemouth less than 12.0 in. This is probably the result of the lake having been drawn down and predation on the YOY fish. The catch rate for bass greater than 12.0 in and  $\geq 15.0$  in is consistent with previous surveys; however the catch rate for bass  $\geq 20.0$  in is greater than ever observed. Mauzy was electrofished again in October (Tables 44-45) to document mean length and catch rate of age 0 bass.

### Bluegill Redear Sunfish Sampling

Electrofishing to assess the bluegill and redear sunfish populations was conducted in May (Tables 37, 46-49). The bluegill population could not be sampled in 2008 due to expansive milfoil beds along the shoreline. The leaking water control structure allowed the lake to remain lower than normal resulting in an increased abundance of shoreline vegetation. Bluegill sampling was not possible in 2009 either, due to the drawdown. Although flooded

terrestrial vegetation present before the lake reached full pool hampered sampling in 2010, results from the 2010 sample are similar to past surveys. As with the largemouth bass population, the population will take a few years to stabilize.

Redear sunfish were stocked in Lake Mauzy in 2004 and 2005 following renovation in 2003. Less than 10 redear sunfish were collected per electrofishing survey prior to 2007, during which 49 were collected. The 169 collected in 2010 shows promise that the redear sunfish population may finally develop into a viable fishery at Mauzy.

#### Channel Catfish Sampling

Channel catfish were sampled via tandem hoop net sets in October to determine length distribution and growth rate to assess the current annual stocking rate of 50 fish/acre (Tables 50-51). Three tandem hoop net sets (3 nets in series) were fished for 3 days the first week of October. Growth rate is good and the population is comprised of primarily ages 1-3 with a few fish in the age 4-6 range. Sampling will be conducted again to determine population statistics after 2-3 years of a stable lake level.

### **Carpenter Lake**

#### Largemouth Bass

Largemouth bass were electrofished at Carpenter Lake during April 2010 to determine population parameters (Tables 28, 52-57). Catch rates at Carpenter Lake have been erratic, but the general trend since 2003 has been an increase in the number of bass <12.0 in and a decrease in the number of bass  $\geq 12.0$  in. Age data collected during 2010 indicate growth rates have slowed since last determined in 2007 and few fish are reaching 12.0 in prior to age 5. Carpenter Lake SMP objectives for largemouth bass management state: a mean length age 3 at capture of  $\geq 11.5$  in, a CPUE of  $\geq 46.00$  fish/hr for age 1 fish, a CPUE of  $\geq 35.00$  fish/hr for 12.0-14.9 in fish, a CPUE of  $\geq 20.00$  fish/hr for  $\geq 15.0$  in fish and a CPUE of  $\geq 1.00$  fish/hr for  $\geq 20.0$  in fish. The CPUE of age 1 fish was the only objective met in 2010. Largemouth bass were electrofished again in October to build an index of mean length and CPUE data for age 0 fish (Tables 58-59).

#### Bluegill Redear Sunfish Sampling

Electrofishing to assess the bluegill/redear sunfish populations was conducted in May (Tables 37, 60-65). Bluegill catch rates at Carpenter Lake are erratic as well, due in part to habitat conditions and sampling inefficiencies. Although down slightly in 2010, a trend for the past several years has been an increasing catch rate of bluegill <8.0 in and a decreasing catch rate of bluegill  $\geq 8.0$  in since gizzard shad were first discovered in Carpenter Lake in 2006. Age data collected in 2010 is similar to age data last collected in 2007, but both indicate growth rate has slowed from age data collected during 2002. The addition of shad as another forage species may be leading to the increased number of small bluegill as largemouth bass predation on bluegill decreases. Carpenter Lake SMP bluegill management objectives state: a mean length age 2 at capture of  $\geq 5.0$  in, 2-2+ years to reach 6.0 in, a CPUE of at least 50.00 fish/hr for bluegill  $\geq 6.0$  in, and a CPUE of at least 15.00 fish/hr for bluegill  $\geq 8.0$  in. The CPUE objective for bluegill  $\geq 6.0$  in. was the only objective met in 2010.

### **New Kingfisher Lake**

#### Largemouth Bass Sampling

The largemouth bass population was sampled at New Kingfisher Lake in April 2010 (Tables 28, 66-68). New Kingfisher Lake's largemouth bass population has historically been dominated by an abundance of slow-growing 8.0-11.0 in fish. Sublegal largemouth bass were removed on a couple of occasions via electrofishing to reduce competition and increase growth. In April 2008, the catch rate of 8.0-11.9 in bass began decreasing and the catch rate of 12.0-14.9 in bass increased. However, a major fish kill occurred at both New and Old Kingfisher Lakes in September 2008, killing large numbers of fish in both lakes. Catch rates in 2009 were much lower than previous years, especially the catch rate for 8.0-11.0 in bass. Results from the 2010 survey indicate the reduction in the number of the sub-legal bass has allowed the remaining bass to grow and move into the 12.0-14.9 in and  $\geq 15.0$  in ranges. Old and New Kingfisher lakes are both highly eutrophic and have experienced periodic late summer oxygen

declines leading to shad die-offs for many years. Total renovation (draining and dredging) would enhance the long term viability of these lakes tremendously. New Kingfisher Lake was again electrofished in October (Table 69) to document length distribution.

#### Bluegill Sampling

The bluegill population was electrofished during May 2010 to document population statistics (Tables 37, 70-72). In 2009, the bluegill catch rate at New Kingfisher nearly doubled, most likely in response to the lack of bass predation from the 2008 fish kill. In 2010, the catch rate of < 6.0 in bluegill decreased and the catch rate of bluegill  $\geq 6.0$  in increased slightly. Hopefully this trend will continue in 2011 and the 6.0-7.0 in bluegill will grow into the  $\geq 8.0$  in size range.

#### **Old Kingfisher Lake**

Old Kingfisher Lake was not sampled in 2010 due to equipment problems. As noted earlier, both Old and New Kingfisher lakes would benefit greatly from total renovation.

#### **Washburn Lake**

##### Largemouth Bass

Electrofishing to assess largemouth bass population parameters at Washburn Lake was completed during April (Tables 28, 73-78). The total catch rate for largemouth bass has declined since the initial stockings in 2000 and 2001 following renovation. The catch rate for <12.0 in bass has been fairly stable since 2007, but few fish greater than 12.0 in are collected. Age data collected in 2010 indicate largemouth are growing slowly, there are few fish in the population greater than age 3, and few fish reach 12.0 in.

Washburn's largemouth population has never stabilized following renovation in 2000. Surveys conducted from 2002-2004 revealed an abundance of slow growing 8.0-11.9 in bass. A fertilization program was initiated in the spring of 2004 and growth rates increased. In the spring of 2008 a phytoplankton bloom could not be achieved following fertilizer applications. An alkalinity test in June indicated an alkalinity level of 40 ppm. Approximately 50 tons of lime were applied in late July 2008 which increased the alkalinity to 60 ppm by December 2008. Fertilizer applications again produced plankton blooms during 2009-2010, although the blooms dissipated after approximately a week. Alternative fertilizers and application methods will be utilized during 2011 in an attempt to increase fertility.

Washburn was electrofished again in October to begin building an index of CPUE and mean length of age 0 bass (Tables 79-80). The mean length of age 0 bass as well as the total catch rate and catch rate of  $\geq 5.0$  in age 0 bass declined during 2010. Mean length is similar to previous collections, but CPUE of age 0 fish continues to decline.

##### Bluegill Sampling

Sampling to assess Washburn Lake's bluegill population was conducted in May 2010 (Tables 37, 81-83). Bluegill catch rates in 2010 are similar to prior collections. Age data collected in 2009 indicate growth rates have declined and additional year classes are present in the population compared to when last examined in 2006. The slower growth rate and older fish in the population indicate few fish are reaching a harvestable size and being removed from the population. The slow bluegill growth rate is probably a result of the low fertility as well. Alternative fertilization methods will be tried in 2011 in an effort to increase growth rates.

#### **Peabody WMA**

SCUBA transects to assess fish populations at Goose and Musky Lakes on Peabody WMA were conducted in June (Table 84-85). Transects could not be conducted at Bottom Lake in 2010 due to poor visibility.

Largemouth bass observations at Goose Lake are similar to prior surveys and indicate a stable population. Total bluegill observations decreased in 2010 due to a decline in the number of 3.0-5.0 in bluegill. Redear sunfish

observations increased in 2010 as has been the case since first surveyed in 2005, indicating the redear sunfish population is increasing.

Musky Lake could not be surveyed during 2008 or 2009 due to property boundary issues. Those issues have been settled and Musky Lake is again a component of Peabody WMA. Largemouth bass observations at Musky Lake are similar to those during 2005-2007 and indicate a balanced, stable population. Observations of both bluegill and redear sunfish were greater in 2010 than when last surveyed in 2007. Monitoring will continue to document future population trends.

#### *Merlin Lake*

##### Largemouth Bass Sampling

Merlin Lake was electrofished in April 2010 to document catch rate and size structure for largemouth bass (Table 86). The lower conductivity of this mine lake allows effective electrofishing. Catch rates increased in 2010 compared to the first survey in 2009. Size structure improved as well, with several fish in the 12.0-15.0 in range being collected that were not observed in 2009. Age data collected during 2009 indicate growth rates are slower than non-mine lakes with bass not reaching 12.0 in until age 4 or 5. The fertilization program initiated in 2008 to increase fertility and growth will continue in 2011.

#### *Island Lake*

##### Channel Catfish Sampling

Channel catfish were sampled with tandem hoop net sets in October to determine length distribution and growth rate to assess stocking rate (Tables 87-88). Three tandem hoop net sets (3 nets in series) were fished for 3 days the third week of October. Growth rate is decent, but slower than non-mine lakes. Only age 1-3 fish were collected indicating catfish are being well utilized and overabundance is not a problem. .

#### **Audubon State Park**

##### Largemouth Bass

Audubon State Park Lake was electrofished during April 2010 to document largemouth bass population statistics (Table 89). Audubon SP Lake is a relatively infertile lake in a wooded watershed. Size structure is good, but growth rate data collected in 2009 indicated growth rates were low for both largemouth bass and bluegill. Efforts will be made in 2011 to work with State Park personnel and implement fertilization and habitat improvement programs. Annual sampling will continue to monitor the population.

Table 1. Annual summary of sampling conditions by waterbody, species sampled and date for NWFD lakes during 2010.

| Water body          | Species | Date        | Time (24hr) | Gear     | Weather <sup>a</sup>                 | Water temp. F | Water level | Secchi (ft) | Conditions <sup>b</sup> | Pertinent sampling comments                                      |
|---------------------|---------|-------------|-------------|----------|--------------------------------------|---------------|-------------|-------------|-------------------------|------------------------------------------------------------------|
| Nolin River Lake    | LMB     | 10/6/10     | 1000        | Shock    | Sunny, clear, breezy, 70°s           | 70-73°        | 514.5       | 36"         | Good                    |                                                                  |
| Nolin River Lake    | LMB     | 10/7/10     | 1000        | Shock    | Sunny, light breeze, 80°             | 69°           | 514.5       | 37"         | Good                    |                                                                  |
| Nolin River Lake    | Crappie | 10/25-29/10 |             | Trap Net | Cloudy, sunny, windy, rainy, 50-70°  | 63-66°        | 510.2-508.6 | 24-30"      | Good                    |                                                                  |

## SOUTHWESTERN FISHERY DISTRICT

### Project 1: Lake and Tailwater Fishery Surveys

#### FINDINGS

Lake sampling conditions are summarized in Table 1.

#### **Barren River Lake (10,000 acres)**

##### Black Bass

Black bass were collected by diurnal electrofishing in late April and results are shown in Tables 2-5. Total largemouth bass catch rate (134.83 fish/hr) was slightly higher than the 14 year average of 123.00 fish/hr. Largemouth bass accounted for 93% of the catch and spotted bass accounted for 7 % (CPUE=10.67 fish/hr). No smallmouth bass were collected in this year's spring sample.

Largemouth bass size structure indices (PSD=62 RSD<sub>15</sub>=27) were similar to previous year averages. The spotted bass population continues to be low density (10.67 fish/hr), but high quality (PSD=80 and RSD<sub>14</sub>=18). The smallmouth population statistics are unknown as samples historically have been low.

Fall diurnal black bass sampling in early October (Tables 6-7) indicated an average number (166.57 fish/hr) of young-of-the-year largemouth bass. However, the mean size for age-0 bass was 5.7 in; greatly exceeding the 9-year average of 4.0 in. Growth of early hatched (April spawned fish) age-0 largemouth bass was probably impacted by the high water levels from May through mid July. Though high, water levels were relatively stable throughout the spawn. The prolonged drawdown allowed young of the year access to forage and habitat. Age-0 largemouth catch rate of  $\geq 5.0$  in fish (105.00 fish/hr) was the highest in the past 9 years. Length-weight calculations were omitted due to poor sample size of larger bass, likely due to early sampling time.

Three of the five goals of the Barren River Lake strategic management plan 2010 (BRLSMP) were met: maintain a spring CPUE of  $\geq 20.00$  fish/hr for age-1 bass, maintain a spring CPUE of  $\geq 33.00$  fish/hr for 12.0-14.9 in bass and maintain a total CPUE of  $\geq 135.00$  fish/hr. Age data was not taken this year for bass, so the goal for mean length age-3 at capture was not included in the list of possible goals.

##### Crappie

Trap netting for crappie resulted in the collection of 745 total crappie (619 black crappie and 126 white crappie) in 93 net-nights (Tables 8-16). Most black crappie (52%) fell within the 8.0-9.0 in classes. Most white crappie (52%) fell within the 8.0-11.0 in classes. The crappie population remains dominated by black crappie (83 %). The assessment for both species of crappie was "Fair". The combined crappie assessment was "Fair" as it has been for many years. Black crappie reached harvestable size (9.0 in) in 2.8 years and 10.0 inches in 3.5 years (calculated from Von Bertalanffy equation, FAST 3.0) . White crappie reached harvestable size (9.0 in) in 1.9 years (calculated from Von Bertalanffy equation, FAST 3.0). The following length-weight equation for white crappie should be used with caution due to the small sample size (n=544, black crappie; n=83, white crappie).

$$\text{Black crappie } \text{Log}_{10}(\text{weight}) = -3.728 + 3.496 * \text{Log}_{10}(\text{length})$$

$$\text{White crappie } \text{Log}_{10}(\text{weight}) = -3.727 + 3.437 * \text{Log}_{10}(\text{length})$$

Four of the six objectives of the BRLSMP 2010 were met for crappie species: maintain a fall CPUE of  $\geq 6.00$  fish/net-night for all crappie excluding age-0, maintain a fall CPUE of  $\geq 1.00$  fish/net-night for age-0 crappie, maintain a fall CPUE of  $\geq 3.00$  fish/net-night for  $\geq 8.0$  in crappie and maintain a total fall crappie CPUE of 7.00 fish/net-night. The goal for maintaining a mean length age-2 at capture of 9.8 in was not reached due to the high percentage of black crappie. The goal of maintaining a fall CPUE of  $\geq 4.00$  fish /net-night for age 1 fish was not met this year due to the weak 2009 year classes of both black and white crappie.

### White Bass / Hybrid Stripped Bass

Gill netting for white bass and hybrid striped bass was completed in early-November. Very low numbers of hybrids were collected; white bass population numbers continue to be very low. The low numbers of hybrids is non-typical. Hybrids will be sampled in 2011 using standard sampling protocol. Sampling results can be found in the Lake Fisheries Research Section annual performance report.

### **Barren River Lake Creel (10,000 acres)**

**Creel survey:** Results of a roving, daytime creel survey are presented in Tables 17-24. Anglers made an estimated 42,171 trips and fished for 177,004 hours with the average trip approximating 4.19 hours. Black bass continued to be the most sought after fish accounting for 39% of effort followed by crappie (23%), catfish (15 %) and morone (10%).

Bass angler trips (16,683) decreased slightly from 2007, but hours fished (70,026) remained similar to 2007 (70,659). These statistics are interesting, since in 2007 the lake never reached summer pool and in 2010 the lake was 20 ft over pool for a better part of 2 months during prime bass fishing times of May and June.

Crappie angler trips were up (10,013) from the 2007 creel (7,029) and hours fished were almost 2 times (42,031) higher than the 2007 creel (19,196). Crappie harvest was also up from 10,014 fish in 2007 to 41,037 in 2010. Crappie catch was dominated by black crappie (53%). This does not coincide with fall trap-netting samples that were heavily dominated by black crappie (83%). This could be due to misidentification by anglers. Crappie fishing really picked up in the latter half of the year. (Table 19)

Catfish angler trips were up slightly in 2010 (3,169) from the 2007 creel (3,070), but hours fished increased from 8,384 hours in 2007 to 13,302 hours in 2010. Harvest number dropped greatly from 2,653 in 2007 to 494 in 2010. June and July continue to be the months of highest harvest (Table 20).

**Angler attitude survey:** Results of the angler attitude survey are presented in Figure 1. Similar to the 2007 attitude survey, anglers identified bass (49%) and crappie (31%) as species they fished for most. Catfish (12%) increased slightly from the 2007 creel. Angler satisfaction with bass, crappie, hybrid and catfish fisheries was overwhelmingly good with 77% or greater of responses falling in the "very satisfied to somewhat satisfied" categories.

Response of all anglers to the proposed crappie creel reduction to 20 fish per day was overwhelmingly supportive (60% support, 28% no opinion). Support for one catfish per day greater than 34.0 in was similarly supportive (56% support, 36% no opinion). Few anglers expressed dissatisfaction with current regulations. One noteworthy area was the number of fisherman that wanted an increase in the crappie size limit to 10.0 in and a decrease in the crappie creel limit to 20 fish per day.

### **Briggs Lake (18 acres)**

#### Black Bass

Diurnal largemouth electrofishing samples were collected on April 19 (Tables 25-27). Largemouth catch rate (312.00 fish/hr) was just above the goal of 300.00 fish/hr in the Briggs strategic management plan (BRGSMP 2009). Although the PSD is only 15, this population parameter for largemouth bass is desired for accomplishing sunfish management goals set in the BRGSMP 2009.

### Sunfish

The sunfish population was sampled by diurnal electrofishing on the May 6, 2010 (Tables 28-33). Bluegill CPUE for fish  $\geq 6.0$  in (206.40 fish/hr) greatly exceeded the BRGSMP goal of 100.00 fish/hr. Catch rate of  $\geq 8.0$  in bluegills (52.80 fish/hr) was the highest catch rate in the past 5 years. No bluegill age data was taken, so goals for growth were not included in the goals section. The other BRGSMP sunfish goal of maintaining a total CPUE of greater than 100.00 fish/hr of 6.0-in sunfish was also met.

Redear CPUE  $\geq 8.0$  in (17.60 fish/hr) was the only redeer goal of the BRGSMP 2009 management plan met. CPUE of  $\geq 10.0$  in reedar was 1.60 fish/hr which was just below the goal of 1.80 fish/hr. Numbers of 6.0-7.9 in reedar were down from the past 3 years, but catch rates of reedar  $\geq 8.0$  in remained stable. The decrease in 6.0-7.9 in fish could be due to sampling time as noted in previous years' samples.

### Channel catfish

Catfish were sampled with 4 sets of tandem baited hoop nets with 3 days of soak time (Tables 34-35). The population density assessment was muddled by stocking of channel catfish in mid-August, 1-month prior to the sampling date. Although the sample was dominated by stock sized fish (9.0 – 10.0 in), seemingly good numbers of age-2+ fish were seen. Otolith age data (n=35) indicated channel catfish achieved 15.0 in by age-2+.

## **Spurlington Lake (25 acres)**

### Black Bass

Results of nocturnal largemouth bass electrofishing are shown in Tables 36-38. Catch rate for  $\geq 20.0$  in fish (4.00 fish/hr) was the second highest seen in the past 9 years. The bass population remains diverse (PSD=43). Four of the five goals in the Spurlington strategic management plan (SPLSMP 2009) for largemouth bass were achieved. The only goal not met was CPUE of 12.0-14.9 in fish.

### Sunfish

Results of bluegill and reedar diurnal sampling on May 19, 2010 are shown in Tables 39-43. One of two possible goals in the SPLSMP 2009 management plan was met this year: CPUE of bluegill  $\geq 6.0$  in (102.00 fish/hr). The catch rate of fish  $\geq 8.0$  in fell significantly. This could be due to sampling timing or water conditions.

Young reedar (CPUE 24.00 fish/hr) are up from last years samples (Table 40). This increase in the young reedar is a good sign that the initial stockings from 2007-2009 have led to an established population. Numbers of reedar larger than 6.0 in fell from last year's samples. Larger individuals likely spawned earlier and already moved to deeper water and were not susceptible to the gear, as larger reedar were noted during spring bass sampling. This has been observed in other district lakes as well.

## **Marion County Lake (25 acres)**

### Black Bass

Results of nocturnal largemouth bass electrofishing are shown in Tables 44-47. The catch rate of 470.86 fish/hr meets the largemouth bass goal in the Marion County Lake Strategic Management Plan (MCLSMP 2009) of maintaining a high density largemouth bass population (CPUE  $\geq 385.00$  fish/hr). The largemouth population continues to be dominated by fish  $< 12.0$  in (PSD=4); however this fits the MCLSMP, as this lake is managed for sunfish.

### Sunfish

Diurnal electrofishing results for bluegill and redear on May 10, 2010 are presented in Tables 48-53. One goal of the MCLSMP 2009 plan was met: maintain or exceed a spring CPUE of 5.00 fish/hr of  $\geq 8.0$  in bluegill. Increased aquatic vegetation coverage coupled with resulting increased water clarity could explain reduced catchability of sunfish and lower overall CPUE of diurnal electrofishing in clearer water. 125 tons of lime was applied to the lake in early 2011 in hopes of increasing alkalinity. A second round of grass carp were also added to the lake to help with controlling aquatic vegetation.

No goals of the MCLSMP were met for redear sunfish. Redear catch rates were down for all length groups.

### **Green River Lake (8,210 Acres)**

#### Muskie

Unfavorable sampling conditions (clear water) limited muskie sampling to 3 sites (normally sample 7), reducing effort to 7.5 hours (half of normal effort). Overall, muskie length group catch rates were similar to historic averages (Tables 54-56); however,  $> 30.0$  in and  $> 40.0$  in length groups were notably lower than previous years and failed to meet management objectives. Difficulty of holding the larger fish (40.0-in plus) with the electrofishing gear combined with lower overall encounters (less room for error) make catch rates of this size group inherently more variable. The length-weight equation for muskie is:

$$\text{Log}_{10}(\text{weight}) = -4.51283 + 3.63068 \times \text{Log}(\text{length})$$

similar to previous years.

#### Black Bass

Nocturnal black bass sampling was not conducted in 2010 due to prolonged high water levels (10-15 ft above summer pool) during the month of May.

Fall YOY sampling (Tables 57-58) yielded higher than average overall CPUE (45.00 fish/hr), mean length (4.8 in) and CPUE  $\geq 5.0$  in (18.33 fish/hr) of age-0 largemouth bass. These indices suggest a moderate to strong 2010 year class. Age-0 spotted bass followed similar trends as largemouth, with higher numbers and larger-sized fish.

#### Crappie

Results from trap netting for white crappie are presented in Tables 59-62. The consecutive years of moderate year class strength from 2005 – 2008 are carrying the fishery. Crappie growth continues to suffer as 2010 was among the poorest on record for age-2+ fish (7.8 in). Thankfully, the 2009 year-class seems poor and will not compound growth problems further. Crappie population assessment remained “Fair” due to high CPUE’s of older year classes which eclipsed management objectives of 12.00 fish/nn (CPUE of  $>$  age-0) and 7.00 f/nn (CPUE of  $\geq 8.0$  in fish). CPUE of age-0 (1.27 f/nn) and age-1 (0.67 f/nn) crappie were well below management objectives for those groups. Age-0 CPUE continues to be an inconsistent predictor of year class strength. The length-weight equation for white crappie is:

$$\text{Log}_{10}(\text{weight}) = -3.811551 + 3.4879 \times \text{Log}_{10}(\text{length})$$

#### Walleye/White bass

Results of the experimental gill net sampling for white bass and walleye are shown in Tables 63-66. White bass were collected for the first time since 2007 with 15 of the 16 fish collected being stocked fish (OTC marked). Overall walleye CPUE (4.44 f/nn) slid slightly from last year (6.38 f/nn) due to a slight dip in age-0 fish. All population parameters were similar to previous years. Walleye growth rate remains excellent with fish reaching

18.8 in by age-2+. The walleye population assessment remained "Good" as all management objectives were met. The length-weight equation for walleye is:

$$\text{Log}_{10}(\text{weight}) = -3.77264 + 3.27260 \times \text{Log}_{10}(\text{length})$$

similar to previous years.

The recent establishment of alewives (first noted in 2004 in gill net by-catch) and their effect on white bass and walleye population dynamics remains unclear.

### **Shanty Hollow Lake (136 acres)**

#### *Black Bass*

Nocturnal bass sampling results are shown in Tables 67-70. Overall CPUE of largemouth (277.00 fish/hr) was similar to previous years. Size structure index (PSD = 34) dipped slightly from the previous year (PSD = 42). Similar to previous years, the largemouth bass population assessment remained "Good". Management objectives for age-1 CPUE (20.00 fish/hr) and  $\geq 20.0$ -in CPUE (2.50 fish/hr) were not met. Recruitment of the good year classes of 2005 and 2006 to larger sizes (15.0-in plus) has been slow and likely linked to chronic low water levels from late-summer through fall.

#### *Sunfish*

Sunfish sampling results are shown in Tables 71-76. Bluegill CPUE (277.33 fish/hr) recovered slightly from the previous year's lower value (228.00 fish/hr) due to increased CPUE of smaller fish. Bluegill size structure remains poor (PSD = 14) and the bluegill population assessment stayed at a "Fair" rating. Non-age related management objectives that measure larger fish parameters were not met and were well below desired values.

The redear population remains low density (CPUE = 23.33 fish/hr) and with fair size structure (PSD = 31). The population failed to achieve the only assessable population objective (CPUE of  $\geq 7.00$  fish/hr for 8.0-in plus fish) at 2.00 fish/hr.

Shanty Hollow Lake experiences notable water level fluctuations due to a leak. Water level fluctuations range from 2-12 feet below normal pool within a year depending on rainfall. Erratic population shifts in sunfish and bass whether due to heightened predation, spawning interruptions, etc., may be symptoms of these frequent water level changes.

### **Metcalf County Lake (22 acres)**

#### *Black Bass*

Results of diurnal largemouth bass sampling are presented in Tables 77-79. The bass population remains lower density as overall bass CPUE was 186.00 fish/hr; similar to previous years. The size structure remains diverse (PSD = 35) and was similar to previous years. CPUE of larger bass ( $\geq 20.0$  in) has consistently ranged from 6.00-8.00 fish/hr, well above any lake in the Southwest District.

Though not measured since 2002, condition of larger bass (15.0-in plus) historically has been excellent (2000 -2002;  $W_r = 105$ ). The lake is highly productive and supports a substantial (bluegill 2007 CPUE = 1562.00 fish/hr) and varied (misc. sunfish, gizzard shad and trout) forage base.

### **Mill Creek Lake (109 acres)**

#### *Sunfish*

Results of diurnal sunfish electrofishing are presented in Tables 80-86. Overall, the bluegill CPUE of 698.40 fish/hr was similar to the previous sample in 2005 (516.00 fish/hr); however, the current size structure is dominated by intermediate sized fish (PSD = 9). Bluegill growth was consistently slow throughout their life span as age-2 fish averaged 3.4 in and fish took 4.3 years to achieve 6.0 in.

The redear population is low density (16.80 fish/hr), but high quality (PSD = 95). No redear were collected in the 2005 sampling effort, further suggesting a low population density. The lake is not overly productive and will likely remain so (back up water supply lake for city of Tompkinsville).

### **Fagan Branch Lake (140 A)**

#### *Black Bass*

Nocturnal bass electrofishing results are presented in Tables 87-90. Overall CPUE (328.00 fish/hr) remains similar to recent years. Since institution of a 12.0-15.0 in slot length limit in 2000, CPUE of larger fish ( $\geq 15.0$  in) has improved slightly, but bass growth remains poor (4.5 years to achieve 12.0 in). However, the bass population assessment remains "Fair" despite slow growth. The lake's low productivity, and its obligation to remain so (back up water supply lake for city of Lebanon), combined with current angler attitude of catch and release, will likely continue to encumber bass growth and population improvements.

#### *Sunfish*

Nocturnal bluegill and redear electrofishing results are presented in Tables 91-100. Despite the lake's low productivity, it supports a good bluegill and excellent redear fishery. Overall bluegill CPUE was 1002.00 fish/hr; dramatically higher than previous years (200.00 – 300.00 fish/hr). Two to three-fold increases in smaller fish explain much of the difference from previous years. Size structure for both populations in 2010 was good (bluegill PSD = 33; redear PSD = 36). CPUE of larger bluegill ( $\geq 6.0$  in) was exceptional (256.00 fish/hr) as was larger ( $\geq 8.0$  in) redear (84.00 fish/hr). Growth of both species was slower at smaller sizes. Age-2 bluegill averaged 2.9 in and age-3 redear averaged 5.7 in. Growth rate seemed to increase at larger sizes as time to reach 6.0 in for bluegill was 3.8 years; redear achieved 8.0 inches in 4.6 years.

Table 1. Lake sampling conditions in the Southwestern Fisheries District in 2010.

| Lake          | Date    | Species           | Weather       | Surface water temp.(F) | Conductivity (umhos) | Secchi (in.) | Comments                                           |
|---------------|---------|-------------------|---------------|------------------------|----------------------|--------------|----------------------------------------------------|
| Barren River  | 28-Apr  | Bass              | Clear         | 64-66                  | 210-280              | 12-72        | 8-ft below summer pool                             |

<sup>a</sup> Data collected by fall (October) diurnal electrofishing. Mean lengths were determined by analysis of otolith, removed from a subsample of LMB <9.0 in, and extrapolated to the entire catch of the fall sample.

<sup>b</sup> Data collected during the following spring (April/May) diurnal electrofishing sample.

<sup>A</sup> Data collected by fall (Sept/October) diurnal electrofishing. Mean lengths were determined by otolith taken from a subsample of LMB <9.0 in and extrapolated to the entire catch of the fall sample.

<sup>B</sup> Data collected during the following spring (April/May) nocturnal electrofishing.

## BARREN RIVER LAKE ANGLER ATTITUDE SURVEY 2010 (n=314)

1. Have you been surveyed this year? Yes - stop survey No – continue
2. Name \_\_\_\_\_ and Zip Code \_\_\_\_\_ (Optional)
3. How many times do you fish Barren River Lake a year?  
First time (4.1%)      1 to 4 (10.8%)      5 to 10 (11.5%)      More than 10 (62.7%)
4. Which species of fish do you fish for at Barren River Lake (**check all that apply**)?  
Bass (54.8%)      Crappie (49.7%)      Hybrid Striped Bass (23.2%)      White Bass (1.9%)      Channel Catfish (28.7%)  
Flathead Catfish (6.4%)      Bluegill (3.5%)
5. Which one species do you fish for most at Barren River Lake (**check only one**)?  
Bass (48.6%)      Crappie (30.7%)      Hybrid Striped Bass (7.1%)      White Bass (0%)      Channel Catfish (11.4%)  
Flathead Catfish (0.4%)      Anything (0.4%)      Bluegill (1.4%)

### **-Answer the following questions for each species you fish for – (see question 4)**

#### **Bass Anglers (n=159)**

6. What level of satisfaction do you have with bass fishing at Barren River Lake?  
Very satisfied (56.6%)      Somewhat satisfied (36.5%)      Neutral (4.4%)      Somewhat dissatisfied (1.9%)      Very dissatisfied (0%)      No opinion (0.6%)
- 6a. If you responded with somewhat or very dissatisfied in question (5) – what is the single most important reason for your dissatisfaction?  
Number of fish (37.5%)      Size of fish (0%)      Not happy with regulations (0%)      Too many boaters (12.5%)      Too many tournaments (12.5%)  
Water level (37.5%)

#### **Catfish Anglers (n=79)**

7. What level of satisfaction do you have with the catfish fishing at Barren River Lake?  
Very satisfied (62%)      Somewhat satisfied (26.6%)      Neutral (6.3%)      Somewhat dissatisfied (1.3%)      Very dissatisfied (2.5%)      No opinion (1.3%)
- 7a. If you responded with somewhat or very dissatisfied in question (6) – what is the single most important reason for your dissatisfaction?  
Number of fish (50%)      Size of fish (50%)

#### **Crappie Anglers (n=145)**

8. What level of satisfaction do you have with the crappie fishing at Barren River Lake?  
Very satisfied (35.2%)      Somewhat satisfied (42.1%)      Neutral (10.3%)      Somewhat dissatisfied (8.3%)      Very dissatisfied (2.1%)  
No opinion (2.1%)

- 8a. If you responded with somewhat or very dissatisfied in question (7) – what is the single most important reason for your dissatisfaction?  
 Number of fish (30%) Size of fish (40%) 10 inch size limit (5.0%) Enforcement of regulation (5.0%) High water (5.0%)  
 Water level Fluctuations (10%)

### Hybrid Striped Bass Anglers (n=62)

8. What level of satisfaction do you have with the hybrid striped bass fishing at Barren River Lake?  
 Very satisfied (59.7%) Somewhat satisfied (19.4%) Neutral (9.7%) Somewhat dissatisfied (4.8%) Very dissatisfied (1.6%)  
 No opinion (4.8%)
- 8a. If you responded with somewhat or very dissatisfied in question (8) – what is the single most important reason for your dissatisfaction?  
 Number of fish (50%) Too many boaters (50%)

### All Anglers

1. Would you support or oppose a reduction in the current statewide 30 fish daily crappie creel limit to 20 fish?  
 Support (n=180 60.2%) Oppose (n=34 11.4%) No opinion (n=85 28.4%)
2. KDFWR would like your opinion of a proposed statewide regulation that would provide limited protection of trophy-size catfish. Would you support or oppose a regulation where the angler could continue to keep the same number of catfish under 28 inches as in the past but could keep only 1 catfish greater than 28 inches per day?  
 Support (n=168 56.4%) Oppose (n=23 7.7%) No opinion (n=107 35.9%)
3. Are you **satisfied with the current fishing** regulations in all sportfish at Barren River Lake? Yes (n=193 73.4%) No (n=70 26.6%)

If **NO**:

- 11a. Which species are you dissatisfied with and what size and creel limits would you prefer?

Bass Size Limits (n=3) 10 inch (33.3%)  
 12 inch (33.3%)  
 18.5 inch Smallmouth

Bass Creel limits(n=1) 5 Fish (100%)

Crappie Size limits(n=64) 8 inch (3.1%)  
 10 inch (96.9%)

Crappie Creel limits(n=55) 0 fish (1.8%)  
 15 fish (14.5%)  
 20 fish (67.3%)  
 25 fish (5.5%)  
 30 fish (10.9%)

Are you aware that KDFWR prints a fish attractor map for Barren River Lake? (n=296) Yes (64.2%) No (35.8%) if yes go to 13a.

12a. Do ever you use this map?(n=214) Yes (50%) No (50%)

CENTRAL FISHERIES DISTRICT  
Project 1: Lake and Tailwater Fishery Surveys

FINDINGS

Lake sampling conditions for 2010 are summarized in Table 1.

**Taylorville Lake (3,050 acres)**

Spring diurnal electrofishing was completed in April 2010 to monitor the black bass population. Three sections (Big Beech Creek, Ashes/Jacks Creek, and Van Buren areas) of Taylorville Lake were sampled for 7.5 hours (2.5 hours per section). Numbers of bass collected in 2010 were higher than numbers collected in past years (Tables 2-3). Catch rate of 8.0–11.9 in largemouth bass (36.27 fish/hr) was higher than 2009 (32.93 fish/hr), and equal to the 15-year average (36.29 fish/hr). The catch rate for bass 12.0–14.9 in (49.73 fish/hr) was significantly higher than both last year's catch rate (22.27 fish/hr) and the 15-year average (31.45 fish/hr). Catch rate for bass  $\geq 15.0$  in was 16.40 fish/hr, which was higher than last year's catch rate (13.60 fish/hr), but lower than the 15-year average (17.15 fish/hr) for these harvestable-size fish. The Ashes and Jack's Creek area of Taylorville Lake had the highest catch rate for largemouth bass in 2010. The PSD for largemouth bass increased to 65 from 52 in 2009 (Table 4). However, the  $RSD_{15}$  value decreased from 20 in 2009 to 16 in 2010. Growth rates indicated most bass are reaching harvestable size (15.0 in) between ages 3 and 4 (Table 5). This is a substantial increase compared to the growth rate to harvestable size from the last age and growth study (2006) which showed largemouth bass reaching harvestable size between age 4 and 5. Largemouth bass age frequency (Tables 6 and 7) continued to show high numbers of age 2 and 3 bass (mostly 8.0–14.0 in), with a distinct decline beginning after age 6. Very few bass were present beyond age 6. The largemouth bass population assessment score, based on spring electrofishing data, increased from 11 ("Fair") in 2009 to 16 ("Good") in 2010 (Table 8). Length frequency, relative weight ( $W_r$ ), and age 0 and age 1 year class strength of largemouth bass were collected by electrofishing in September at Taylorville Lake (Tables 9–11). Average body weights for largemouth bass were acceptable, with bass 12.0–14.9 in having the highest weight ratio (Table 10). The year class strength model indicated an average recruitment for young-of-the-year largemouth bass in 2010. Catch rates of age-0 largemouth bass significantly declined from 2009, which was one of the highest catch rates of age-0 largemouth bass recorded. However, catch rates of age-0 largemouth bass (45.73 fish/hr) was almost equal to the 10-year average of 44.01 fish/hr. Even though catch rates of age-0 largemouth bass were average, fingerling (4.0–4.5 in) largemouth bass were stocked in September at a rate of 5 fish/acre, totaling 15,271 (left pectoral clip). Largemouth bass fingerlings have been stocked almost annually since 2000 at rates ranging from 5 fish/acre to 10 fish/acre and from 1985 to 1992 at various rates. The need for stocking and the numbers stocked in reservoirs are based (since 2004) on results of the age 0 year class strength sampled in early September and the predicted age 1 year class strength the following spring.

Trap netting efforts for crappie (Table 12) resulted in the collection of 67 white crappie and 179 black crappie. Crappie were sampled with trap nets during 48 net-nights. Age and growth determinations were completed using otoliths (Tables 14 and 17). Age studies indicated that the majority of white and black crappie reached 9.0 in between age 1 and 2. The crappie population assessment scores (Tables 16 and 19) were 7 and 6 ("Poor") for both white and black crappie, respectively. This is a decline for both species from the "Fair" assessments over the past several years. The cause for the continued decrease in crappie population catch rates in recent years is not entirely known. The crappie population is very cyclic at Taylorville Lake with peaks occurring every 7 to 9 years. The latest peak appears to have been in 2004. In an effort to help recruitment on the lake, 30,710 (10.1 fish/acre) white crappie (2.7 in) were stocked in 2009 and 35,985 (11.7 fish/acre) white crappie (2.5–4.7 in) were stocked in 2010 in Taylorville Lake in the fall. These stocked crappie made up 58% of the white crappie sampled in the fall of 2010. Average weights of white and black crappie in the fall of 2010 were acceptable at Taylorville Lake (Table 20). See the Black Bass Investigation (F-40) Annual Performance Report for further information concerning the crappie stockings at Taylorville Lake.

Fall gill netting for hybrid striped bass and white bass was conducted in October 2010 (Tables 21–29). A total of 51 hybrid striped bass were collected in 2010 compared to 112 in 2009. Hybrid striped bass were captured in 12 net-nights (4 nets for 3 nights) for a CPUE of 4.25 ( $\pm 1.35$ ) fish/net-night. The hybrid striped bass population has exhibited notable fluctuations since 1990. The density of hybrid striped bass in Taylorville Lake appeared to be

negatively related to the amount of tailwater discharge (due to rainfall) and fishing pressure. It is theorized that above-normal discharge leads to escapement of hybrid striped bass but has little effect on the white bass density in the lake. Annual stocking rates for hybrid striped bass have been about 20 fish/acre (1.4 to 2.0 in) for the last 13 years. Age and growth studies were completed for hybrid striped bass using otoliths (Tables 22 and 23). Additionally, hybrid striped bass were differentiated from white bass due to being marked with oxytetracycline (OTC) at the fish hatchery. Studies indicate hybrid striped bass reach harvestable size (15.0 in) between age 2 and 3, typical growth at Taylorsville Lake. The relative weight (Wr) index for hybrid striped bass shows below average body weight for hybrid striped bass. The population assessment for hybrid striped bass was rated at "Fair", the same as 2009 and 2008. A total of 62,902 (20.6 fish/acre; OTC) hybrid striped bass (1.5-1.9 in) were stocked in Taylorsville Lake in 2010.

Data for white bass collected during fall 2010 gillnetting studies is presented in Tables 21 and 26-29. White bass comprised about 80% of the *Morones* sampled, compared to 34% in 2009, 69% in 2008 and 39% in 2007. Age and growth studies indicated white bass reach 12.0 in between age 2 and 3. Relative weight values revealed acceptable body weights, with good weights for small fish and increasing body condition for larger, older fish (Table 28). The white bass population assessment rated "Good", compared to "Poor" in 2009 (Table 29).

See the Black Bass Investigation (F-40) Annual Performance Report for channel catfish and blue catfish sampling data. A total of 23,500 (7.7 fish/acre) blue catfish (8.0-14.0 in) were stocked in Taylorsville Lake in 2010.

### **Herrington Lake (2,410 acres)**

Diurnal electrofishing studies were completed in April 2010 to monitor the black bass population. Upper, middle, and lower sections were sampled for a total of 7.5 hours (2.5 hours per section). Species composition, relative abundance, and CPUE of black bass collected in the spring are presented in Table 30. Largemouth bass dominated the black bass fishery, with spotted bass comprising 18% of the bass sampled. No smallmouth bass were collected in 2010. The catch rate of <8.0 in largemouth bass (41.47 fish/hr) was significantly higher than last year (5.25 fish/hr) and the 15-year average (31.99 fish/hr) catch rates. Additionally, numbers of bass 8.0-11.9 in (34.00 fish/hr) were substantially higher than last year (9.38 fish/hr) but below the 15-year average (41.42 fish/hr). Numbers of 12.0-14.9 in (28.63 fish/hr) and  $\geq 15.0$  in (25.07 fish/hr) largemouth bass increased from last year and were greater than the 15-year averages (28.43 fish/hr and 20.30 fish/hr), respectively (Table 31). The PSD for largemouth bass was 61 compared to 73 in 2009 and 56 in 2008. The RSD<sub>15</sub> was 29 compared to 30 in 2009 and 24 in 2008 (Table 32). The population assessment based on spring electrofishing data indicated a "Good" population (Table 33). Fall electrofishing evaluated largemouth bass relative weight index and index of year class strength (Tables 34-36). Average body weights for largemouth bass were acceptable, with bass 8.0-11.9 in continuing to have the highest weight ratio (Table 35). The year class strength model for Herrington Lake indicated below average recruitment for young-of-year largemouth bass in 2010. CPUE of age-0 bass (22.00 fish/hr) decreased from last year (109.8 fish/hr), while their mean length increased (Table 36). Age-0 CPUE was below the lake average (32.55 fish/hr); therefore, largemouth bass were stocked in October. Fingerling (4.0-4.5 in) largemouth bass were stocked in October at a rate of 16.6 fish/acre, totaling 40,060 fish (left pectoral clip).

Diurnal electrofishing studies were completed in March 2010 to monitor the crappie population. Upper, middle, and lower lake sections were sampled for a total of 4.5 hours (1.5 hours per section). This year, a total of 225 crappie were collected, compared to 99 in 2009, 108 in 2008, 81 in 2007, 84 in 2006, and 367 in 2005 (Table 37). Catch was dominated by black crappie in the middle and lower sections, while white crappie dominated the upper section of the lake. Age and growth studies of white crappie indicated they reach 9.0 in by age 2, and 11.0 in by age 3 (Table 39). Age frequency of white crappie showed that their populations were dominated by age-1 and age-2 fish (Table 40). A population assessment was developed for spring electrofishing of white and black crappie at Herrington Lake. The population assessment for white crappie indicated a "Good" population for 2010 (Table 41). Age and growth studies also showed that black crappie reached 9.0 in between age 2 and age 3 (Table 42). Age-2 fish dominated the black crappie sample (Table 43) indicating a good spawn in 2008. The population assessment for black crappie indicated a "Fair" population for 2010 (Table 44), the same as last year.

Gill netting for hybrid striped bass and white bass was completed in October 2010. During the 15 net-night sampling period, 114 hybrid striped bass and 132 white bass were collected (Table 45). Otoliths were taken from both species for age and growth determinations. Results of these studies indicated excellent growth rates (Tables 46-47 and 49-50). Hybrid striped bass reached 15.0 in between age 1 and 2 (Table 46), as they have historically. Of the

hybrid striped bass sampled, 96% were age 1+ or younger (Table 47). The population assessment for hybrid striped bass indicated a "Good" population, up from a "Fair" assessment last year (Table 48). White bass age and growth determinations showed they reach 9.0 in by age 1 and 12.0 in by age 2 (Table 49). Like hybrid striped bass, 86% of white bass were age 1+ or younger (Table 50). The white bass population assessment indicated a "Good" population, also up from a "Fair" assessment rating from last year (Table 51). Herrington Lake was stocked with 50,224 (20.8 fish/acre; 1.3-1.5 in) hybrid striped bass in June 2010.

A roving daytime angler creel survey was conducted at Herrington Lake from mid March through October. The last creel survey conducted at this lake was in 2004. Table 52 provides descriptive statistical parameters of the lake fishery during the present survey and the last 2 surveys (2004 and 1996). The number of fishing trips in 2010 (11,692) dropped slightly from 2004 (12,878). Accordingly, fishing pressure (man-hours) and number of fish caught continued to decline over time. While numbers and pounds of fish harvested increased, catch rates (fish/hr and fish/acre) have declined over time. Other parameters such as gender, residency, method and mode were similar to surveys completed in past years.

Numbers of largemouth bass caught in 2010 increased by over 4,000 from numbers seen in 2004 (Tables 53 and 54), while numbers of largemouth bass harvested decreased by 25%. Mean length of largemouth bass harvested decreased from 14.2 inches in 2004 to 13.5 inches in 2010. The number of fishing trips for black bass in 2010 was 4,207, an increase from 3,005 trips in 2004. Black bass continued to be the most sought-after group fished for in Herrington Lake. Catch rate of bass by bass fishermen increased from 0.35 fish/hr in 2004 to 0.90 fish/hr in 2010. Bass angler success rate (14.7%) was essentially the same as 2004 (11.9%). Largemouth bass continued to dominate the black bass population with occasional catches of smallmouth bass and spotted bass. Black bass catch, harvest and monthly angling success are shown in Tables 55 and 56.

The *Morone* group (hybrid striped bass and white bass) was the second most sought-after group at Herrington Lake in 2010. The number of hybrid striped bass (HSB) caught decreased slightly from 7,958 fish in 2004 to 7,309 in 2010. However, the number of hybrid striped bass harvested increased from 3,059 in 2004 to 4,408 in 2010. The number of white bass (WB) caught increased slightly with 4,528 caught in 2004 (2,395 harvested) and 5,321 caught in 2010 (3,082 harvested). Pounds of HSB harvested in 2010 totaled 6,415 lbs (2.66 lbs/acre), whereas in 2004 it was 2,654 lbs (1.10 lbs/acre). Pounds of WB harvested in 2010 totaled 1,708 lbs (0.71 lbs/acre) while in 2004 it was 915 lbs (0.38 lbs/acre). Mean length of HSB harvested in 2010 was 14.2 in while in 2004 it was 13.0. Mean length of WB harvested in 2010 was 11.0 in, with 9.6 in being the average in 2004. The number of trips for *Morones* decreased slightly from 2,404 trips in 2004 to 2,102 trips in 2010. Hours spent fishing for these fish also slightly decreased from 13,620 hrs (5.65 hrs/acre) in 2004 to 10,368 hrs (4.30 hrs/acre) in 2010. Harvest rate for *Morone* fishermen increased from 0.31 fish/hr in 2004 to 0.52 fish/hr in 2010. Success rate for these anglers increased from 19% in 2004 to 56% in 2010. *Morone* catch, harvest and monthly angling success are shown in Tables 57 and 58.

Numbers of crappie caught decreased from 8,458 fish caught in 2004 to 3,172 in 2010. Additionally, the number of crappie harvested declined from 6,002 fish in 2004 to 3,045 in 2010. Mean length of crappie harvested was 10.0 in, an increase from 9.4 inches in 2004. Crappie are the third most sought-after group fished for in Herrington Lake. The number of fishing trips for crappie essentially remained the same from 1,599 in 2004 to 1,506 in 2010. Harvest rate by crappie anglers decreased from 0.66 fish/hr to 0.48 fish/hr. Percent success of crappie anglers decreased from 53% in 2004 to 48% in 2010. White crappie represented 38% of the crappie caught (68% in 2004) and 40% of the crappie harvested (63% in 2004). Crappie catch, harvest and monthly angling success are shown in Tables 59 and 60.

Panfish (bluegill) were the fourth most sought after fish group at Herrington Lake in 2010. The number of panfish caught in 2010 (20,883 fish) significantly declined from the number of panfish caught in 2004 (46,267 fish). Pounds harvested in 2010 were less than that seen in 2004, declining from 2,008 lbs (0.83 lbs/acre) in 2004 to 1,679 lbs (0.70 lbs/acre) in 2010. The average length of bluegill harvested was 5.5 in, an inch less than the average size caught in 2004 (6.5 in). Trips for panfish decreased from 1,961 trips in 2004 to 1,498 trips in 2010. The harvest rate for panfish was 1.50 fish/hr (1.10 fish/hr in 2004). The percentage of successful panfish anglers was 77% while in 2004 it was 46%. Panfish catch, harvest and monthly angling success are shown in Tables 61 and 62.

The fifth most sought-after group was the catfish with 771 trips by catfish anglers compared to 1,011 trips in 2004. Catfish numbers caught declined from those seen in 2004. Channel catfish contributed 78% of the catfish caught, compared to 58% in 2004. Pounds of catfish harvested increased from 2,680 lbs in 2004 to 5,407 lbs in 2010. Pounds of flathead catfish harvested by catfish anglers increased from 1,542 lbs in 2004 to 1,941 in 2010. Mean length of channel catfish harvested by catfish anglers was 13.2 in (17.2 in 2004) while that of flathead catfish was 15.5 in (20.1 inches in 2004). Harvest rate by catfish anglers increased from 0.14 fish/hr to 0.52 fish/hr over the same period. Success rate for catfish anglers increased from 30% in 2004 to 77% in 2010. Catfish catch, harvest and monthly angling success are shown in Tables 63 and 64.

An angler attitude survey was conducted at Herrington Lake during the creel survey. Surveys were completed in the field by the creel clerk. A total of 130 surveys were completed by anglers (171 surveys in 2004). The attitude survey reflected the sharp decrease in anglers seeking largemouth bass, and the increase in preference for crappie. The majority of anglers expressed an increase in satisfaction for their species of preference from the 2004 survey. The majority of anglers (86%) are satisfied with the current regulations on Herrington Lake.

### **Guist Creek Lake (317 acres)**

Spring electrofishing studies were completed for length frequency, CPUE, age frequency and population assessment for largemouth bass in April 2010 (Table 65). Total largemouth bass catch rate (all sizes) increased from the last year (Table 66). The PSD for largemouth bass was 74 compared to 70 in 2009 and 85 in 2008 (Table 67). The RSD<sub>15</sub> was 44 compared to 46 in 2009 and 54 in 2008. Over 45% of the bass collected were  $\geq 13.0$  in, whereas 27% were  $\geq 16.0$  in, and 12% were  $\geq 18.0$  in. The population assessment gave a rating of "Good", the same as the last five years (Table 68). Fall sampling was conducted for relative weight and index for year class strength at age 0 and age 1 (Tables 69–71). Relative weights indicated very good body condition for bass, especially for bass over 12.0 in. Mean length of age-0 largemouth bass (4.9 in) increased from last year (3.7 in); however, their catch rate decreased from 2009 (51.33 fish/hr to 41.33 fish/hr). The year class strength model indicated below average recruitment for young-of-year largemouth bass in 2010. Therefore, fingerling (3.9 in) largemouth bass were stocked in October at a rate of 11.5 fish/acre, totaling 3,640 (left pectoral clip).

Gill netting was completed in November for hybrid striped bass (Table 72). Four nets were fished for two nights (8 net-nights) in similar sites as in past years. A total of 32 hybrid striped bass were captured compared to 26 in 2009. Age and growth studies were completed using otoliths. Calculations indicated hybrid striped bass continued to reach 15.0 in by age 2, and 20.0 in by age 3 (Table 73). Relative weights of these fish indicated hybrid striped bass were significantly below average in weight for their size (Table 75). The population assessment indicated a rating of "Poor", a decline from the "Fair" rating in 2009 (Table 76). Guist Creek Lake was stocked with 19,838 (62.6 fish/acre; 1.6 in) hybrid striped bass in June 2010.

Results of the fourth year of channel catfish sampling at Guist Creek Lake with baited tandem hoop nets by the Black Bass Research Project are presented in their Annual Performance Report. Guist Creek Lake was stocked with 3,167 (10.0 fish/acre; 7.5-17.0 in) channel catfish in July 2010.

A population estimate of largemouth bass  $\geq 8.0$  in was conducted on Guist Creek Lake in April 2010. During routine spring sampling, a total of 307 largemouth bass were marked with a hole punch to the soft dorsal fin. A couple of weeks later, district personnel sampled the lake to check for marked fish. Of the 284 largemouth bass that were caught, a total of 50 were marked. Using the Peterson mark-recapture estimator with the Chapman modification equation, Guist Creek Lake was calculated to have 1,744 largemouth bass (6.0 fish/acre; 90% CI 337).

### **Beaver Lake (158 acres)**

Beaver Lake was sampled for largemouth bass in April 2010 (Table 77). The CPUE for all sizes was 238.22 fish/hr compared to 249.00 fish/hr in 2009 and 317.50 fish/hr in 2008 (Table 78). Catch rates for bass  $< 8.0$  in significantly increased, the highest since 2006. Numbers of bass in other length groups (8.0 - 11.9 in, 12.0-14.9 in, and  $\geq 15.0$  in) decreased from last year. Thick aquatic vegetation continues to hamper spring electrofishing sampling. The PSD and RSD<sub>15</sub> for largemouth bass respectively, were 38 and 2, compared to 38 and 1 in 2009 and 25 and 3 in 2008 (Table 79). Growth rates indicated that the bass population at Beaver Lake is severely stunted. Bass were reaching harvestable size (15.0 in) in approximately 6 years (Table 80 and 81). This was a major decline in growth rates because the growth from the last age and growth study (2006) showed largemouth bass reaching harvestable size between ages 4 and 5. Most bass collected (87%) were less than age 5 (Table 81). The population assessment

score indicated a "Good" bass population (Table 83), compared to "Fair" in 2009. Fall electrofishing was conducted for relative weights and the index of age 0 year class strength of largemouth bass at Beaver Lake (Tables 84 and 85). The relative weight index reflected below-average weights for all three length groups, possibly due to crowding and impacts from dense aquatic vegetation. Mean length and catch rate of age 0-bass decreased in 2010 (Table 86). The catch rate of age-0 bass was well below the lake average (102.7 fish/hr). However, due to the severely stunted bass population, bass were not stocked in 2010. Finally, no shad were observed at Beaver Lake in 2010.

Bluegill and redear sunfish were sampled in May 2010 for CPUE, PSD, age and growth, and age frequency (Tables 87-92). Length frequency results showed the majority of bluegill are in the 3.0-4.0 in range, with most redear sunfish between 6.0 and 9.0 in (Table 87). The PSD for bluegill dropped to 17 compared to 41 in 2009 and 37 in 2008. The RSD<sub>3</sub> was 3 compared to 2 in 2009 and 3 in 2008. Redear sunfish PSD and RSD<sub>9</sub>, respectively, were 60 and 17 (Table 88). CPUE for bluegill  $\geq 8.0$  in was 4.40 fish/hr, higher than last year, while the catch rate for 6.0-7.9 in bluegill was significantly lower than last year (Table 89). Age and growth studies indicated bluegill reached 6.0 in by age 3 and 8.0 in between age 7 and 8 (Table 90). The population assessment for bluegill indicated a "Fair" population rating, the same as the last several years (Table 93). The high density of smaller bluegill may be attributed to lack of predation due to thick aquatic vascular plant growth. The catch rate of redear sunfish  $\geq 8.0$  in was 33.60 fish/hr compared to 29.60 fish/hr in 2009 (Table 94). Overall, catch rates for all sizes were slightly higher than last year, except for the slight decrease in  $< 3.0$  in and 3.0-5.9 in catch rates. Age and growth studies continued to show redear sunfish reaching 6.0 in between age 2 and 3, and 8.0 at age 4 (Table 95). Three redear sunfish  $\geq 10.0$  in were collected in 2010, the first time since 2002. Age frequency (Table 96) indicated a good number of redear sunfish through age 6 in the fishery. Redear sunfish numbers have increased since the gizzard shad and grass carp removal, which resulted in an increase in aquatic vegetation. The population assessment indicated a "Good" redear sunfish fishery (Table 98). Relative weight data for bluegill and redear sunfish continued to show average weights for all length groups (Table 99). For additional information on Beaver Lake panfish, consult the Lake Fisheries Research Investigation (F-40) Annual Performance Report.

Aquatic vegetation was prevalent in shallow areas of the lake during spring and early summer. One application of an aquatic herbicide (Aquathol Super K, Dipotassium salt of endothall) was made to submerged aquatic vascular plants around the fishing pier and embayments to maintain fishing and boating access on April 9<sup>th</sup>. No liquid fertilizer applications have been made since 2001.

A population estimate of largemouth bass  $\geq 8.0$  in was conducted on Beaver Lake in April 2010. During routine spring sampling, a total of 199 largemouth bass were marked with a hole punch to the soft dorsal fin. A couple of weeks later, district personnel sampled the lake to check for marked fish. Of the 466 largemouth bass that were caught, a total of 23 were marked. Using the Peterson mark-recapture estimator with the Chapman modification equation, Beaver Lake was calculated to have 4,032 largemouth bass (26.0 fish/acre; 90% CI 1,268).

#### **Boltz Lake (92 acres)**

Spring electrofishing for largemouth bass length frequency, CPUE, PSD, age frequency and population assessment was done in April 2010 (Table 100). Results indicated an increase in bass numbers from last year (Table 101). Growth rates indicated most bass are reaching harvestable size (12.0 in) between age 3 and 4 (Table 103). Most bass (88%) were age 5 or younger ( $\leq 15.0$  in, Table 104). The population assessment indicated a "Good" bass population, the same as last year's rating (Table 106). Electrofishing for largemouth bass relative weight and YOY data was conducted in September (Tables 107-109). Relative weights indicated average condition for largemouth bass (Table 108). Fall sampling indicated below average numbers of age 0 bass, (36.00 fish/hr; average= 49.10 fish/hr); however, the average size increased from 2009 (Table 109). Currently, Boltz Lake does not contain a population of gizzard shad.

Spring electrofishing for bluegill was conducted in May 2010 (Tables 110). Catch rates for all sizes of bluegill, except 3.0-5.9 in, increased in 2010 (Table 112). Age and growth data indicated bluegill reached 6.0 in between age 2 and age 3, an improvement from 2009 (Table 113). The majority (86%) of bluegill collected was age 1 through age 3 (Table 114). The population assessment for bluegill indicated a "Good" population present, an improvement from last year's "Fair" rating. (Table 116).

A total of 70 common carp were removed from Boltz Lake in June. The average weight of removed common carp was 8.73 lbs. Therefore, it was estimated that 611 lbs of common carp were removed from Boltz Lake in 2010.

Boltz Lake has been a blue catfish study lake (Black Bass Research Project) since 1998. Boltz Lake was stocked with 920 (10.0 fish/acre; 6.5-12.0 in) blue catfish in September 2010.

#### **Bullock Pen Lake (134 acres)**

Bullock Pen Lake was electrofished in April 2010 for largemouth bass length frequency, CPUE, age frequency and population assessment (Table 117). Overall, the bass catch rate (132.25 fish/hr) was lower than last year's catch rate (147.50 fish/hr), and lower than the 15 year average (136.44 fish/hr) (Table 118). The PSD for largemouth bass was 73 and  $RSD_{15}$  was 45 in 2010 (Table 119). The 2010 population assessment for largemouth bass indicated a "Fair" population present, a decline from last year's "Good" rating (Table 120). Electrofishing was conducted in September to determine the relative weights and YOY year class strength for largemouth bass (Table 121). Relative weights indicated excellent body condition for bass, particularly larger fish (Table 122). CPUE for both age-0 and age-0  $\geq 5.0$  in increased from last year (Table 123). Age-0 CPUE (42.67 fish/hr) was significantly greater than the lake average (19.74 fish/hr); therefore, largemouth bass were not stocked into Bullock Pen Lake in 2010. Bullock Pen Lake has hosted a population of gizzard shad for decades.

Bullock Pen Lake has been a blue catfish study lake (Black Bass Research Project, F-40) since 1998. Bullock Pen Lake was stocked with 1,340 (10.0 fish/acre; 6.5-12.0 in) blue catfish in July 2010.

#### **Corinth Lake (96 acres)**

Corinth Lake was electrofished in April 2010 to collect largemouth bass length frequency, CPUE, PSD, age frequency and population assessment information (Table 124). The catch rate for largemouth bass decreased from last year for all length groups of largemouth bass, except for  $< 8.0$  in largemouth bass (Table 125). The PSD for largemouth bass was 33, slightly lower than the last two years value of 35 (Table 126). The  $RSD_{15}$  increased from 22 in 2009 to 23 in 2010. The population assessment for largemouth bass was rated "Good", the same as 2009 (Table 127). Fall electrofishing for largemouth bass was conducted to determine year class strength and relative weight (Tables 128). Relative weights of largemouth bass continue to be below average (Table 129). Largemouth bass mean length at age 0 and catch rates of all age 0 sizes significantly increased from last year (Table 130). Age-0 CPUE (140.00 fish/hr) was significantly greater than the lake average (85.54 fish/hr), therefore, largemouth bass were not stocked into Corinth Lake in 2010.

Electrofishing for bluegill and redear sunfish was completed in May 2010 to obtain length frequency, CPUE, age and growth, age frequency and population assessment data (Table 131). Most bluegill were 4.0-6.0 in (Table 131). The bluegill PSD was 30 compared to 52 in 2009 (Table 132). Collection of larger bluegill (6.0 to 7.9 in) showed a significant decline from the previous 3 years (Table 133). Age and growth studies showed that bluegill reach 6.0 in between age 3 and 4 (Table 134). The population assessment indicated a "Fair" population, identical to the last six years (Table 137). Redear sunfish numbers and quality decreased in 2010, with most fish between 6.0 and 8.0 in. Redear sunfish PSD was 58 compared to 85 in 2009. Catch rate for redear sunfish  $\geq 8.0$  in declined from 38.00 fish/hr in 2009 to 12.00 fish/hr in 2010 (Table 138). No  $\geq 10.0$  in redear sunfish were collected in 2010. Age and growth studies show redear sunfish reaching 8.0 in between age 3 and 4 (Table 139). The population assessment for redear sunfish continued to be rated "Good" (Table 142). Relative weights for bluegill and redear sunfish were collected in the fall. Relative weights indicated average body condition for bluegill and redear sunfish, except that body condition of 6.0-7.9 in bluegill was poor (Table 143).

Channel catfish were sampled in October using tandem hoop nets at Corinth Lake in 2010. Length frequency results for channel catfish showed a good size distribution between 8.0-17.0 in (Table 144). The largest channel catfish sampled was 17.9 in. The PSD and  $RSD_{24}$  for channel catfish were 1 and 0, respectively (Table 145). Age and growth studies showed channel catfish reached 12.0 in between age 2 and 3, and 15.0 in between 5 and 6 years (Table 146). Relative weights indicated average condition for channel catfish (Table 148).

A daytime roving creel survey was conducted at Corinth Lake in 2010. The last creel survey was completed in 2002. In 2010, fishing trips totaled 2,620 (Table 149), which was slightly higher than the trips in 2002 (2,481 trips). Overall, catch and harvest rates were lower in 2010 than rates seen in 2002. Largemouth bass catch rates

declined from 7,211 (75.12 f/a) in 2002 to 2,747 (28.62 f/a) in 2010, however, harvest in 2010 (130 fish; 1.35 f/a) was higher than in 2002 (60; 0.62 f/a) (Table 150). Crappie harvest increased from 134 (0.40 f/a) in 2002 to 727 (7.57 f/a) in 2010, whereas, panfish harvest decreased from 11,944 (124.41 f/a) in 2002 to 3,557 (37.06 f/a) in 2010. However, catfish harvest did not change much from 2002, 309 (3.22 f/a) in 2002 to 346 (3.61 f/a) in 2010. Length distribution of harvested and released fish is shown in Table 151. Black bass harvest, release, and monthly angling success are shown in Tables 152 and 153. Crappie harvest, release and monthly angling success are shown in Tables 154 and 155. Channel catfish harvest, release and monthly angling success are presented in Tables 156 and 157. Panfish harvest, release and monthly angling success are presented in Tables 158 and 159. An angler attitude survey was conducted and was based on 330 surveys. According to this survey, bluegill were sought after the most (63.0%), and the majority of angler's time was spent fishing for them (40.3%). Overall, the majority of anglers were satisfied with bass, crappie, catfish, and panfish fishing on Corinth Lake in 2010.

#### **Elmer Davis Lake (149 acres)**

Elmer Davis Lake was sampled for largemouth bass in April 2010. Length frequency, CPUE, PSD, age and growth, age frequency and population assessment data were collected (Table 160). Catch rates of largemouth bass were similar to last year for all sizes except <8.0 in largemouth bass that decreased by 45.00 fish/hr (Table 161). Numbers of bass in the protected slot (12.0-15.0 in) and bass  $\geq 15.0$  in were essentially the same as last year. The PSD for largemouth bass was 39 compared to 35 in 2009 (Table 162). The  $RSD_{15}$  was 10 compared to 9 in 2009. Population assessment data indicated a "Good" population, the same as last year (Table 163). Fall electrofishing for relative weights and year class strength of largemouth bass was completed in September 2010 (Table 164). Relative weights continued to indicate below average body condition (Table 165) as would be expected in a bass-crowded population. Studies indicated that numbers of age 0 bass in the fall of 2010 were the same as 2009; therefore, largemouth bass were not stocked into Elmer Davis Lake (Table 166).

Electrofishing for length frequency, CPUE, age and growth, age frequency and population assessment was conducted for bluegill and redear sunfish in May 2010 (Table 167). Overall bluegill catch rates increased in 2010; however, catch rates declined for bluegill  $\geq 6.0$  in (Tables 169). The PSD value for bluegill was 17 compared to 38 in 2009 (Table 168). The  $RSD_8$  decreased to 0 compared to 1 in 2009. Age and growth studies on bluegill showed that they reached 6.0 in between age 2 and 3 (Table 170). Most bluegill (95%) were age 3 and less (Table 171). The population assessment for bluegill was found to be "Fair", the same as last year (Table 173). Overall catch rates of redear sunfish increased from 2009 (Table 174). The PSD for redear sunfish was 51 compared to 42 last year. The  $RSD_9$  was 11 compared to 8 in 2009 (Table 168). Age and growth studies indicated good growth rates with redear sunfish reaching 6.0 in between age 1 and 2, 8.0 in between age 2 and 3, and 10.0 in between age 5 and 6 (Table 175). The redear sunfish population assessment indicated a "Good" population, the same as last year (Table 178). Relative weight results for bluegill indicated very good body condition, while the index for redear sunfish indicated excellent body condition (Table 179). This year's sampling of bluegill and redear sunfish may have been impacted by excessive growth of aquatic vegetation (mainly *Potamogeton crispus*) at Elmer Davis Lake. Gizzard shad removal efforts were conducted in 1994 and 1997 with success. However, a source for gizzard shad invasions can be attributed to the city of Owenton's water supply reservoir, Lower Thomas Lake, located in the drainage of Elmer Davis Lake. Gizzard shad have again become established due to overflow from Lower Thomas Lake during spring high water events. For additional information on Elmer Davis Lake panfish, consult the Lake Fisheries Research Investigation (F-40) Annual Performance Report.

#### **Kincaid Lake (183 acres)**

Spring electrofishing studies were conducted in April 2010 for PSD, length frequency, age frequency and CPUE for largemouth bass (Table 180). Total catch rate decreased from 265.50 fish/hr in 2009 to 217.50 fish/hr in 2010 (Table 181). The largemouth bass PSD and  $RSD_{15}$ , respectively, were 64 (71 in 2009) and 34 (43 in 2009) in 2010 (Table 182). The population assessment indicated a "Good" bass population, the same as the past ten years (Table 183). Fall electrofishing for relative weight and index of year class strength at age 0 was conducted in September (Table 184). Relative weights of all largemouth bass length groups were about average (Table 185). CPUE for both age-0 and age-0  $\geq 5.0$  in increased from last year (Table 186). Age-0 CPUE (53.33 fish/hr) was significantly greater than the lake average (35.36 fish/hr), therefore, largemouth bass were not stocked into Kincaid Lake in 2010. Kincaid Lake has hosted a population of gizzard shad for decades.

Channel catfish were sampled in October using tandem hoop nets at Kincaid Lake in 2010. Length frequency results for channel catfish showed a good size distribution between 6.0-23.0 in (Table 187). The PSD and

RSD<sub>24</sub> for channel catfish were 16 and 0, compared to 36 and 3 in 2009 (Table 188). Relative weights indicated average condition for channel catfish (Table 189).

A population estimate of largemouth bass  $\geq 8.0$  in was conducted on Kincaid Lake in April 2010. During routine spring sampling, a total of 385 largemouth bass were marked with a hole punch to the soft dorsal fin. A couple of weeks later, district personnel sampled the lake to check for marked fish. Of the 426 largemouth bass that were caught, a total of 92 were marked. Using the Peterson mark-recapture estimator with the Chapman modification equation, Kincaid Lake was calculated to have 1,783 largemouth bass (10.0 fish/acre; 90% CI 236).

#### **McNeely Lake (51 acres)**

McNeely Lake was electrofished for largemouth bass population analysis in April 2010. Data for length frequency, CPUE, PSD, age frequency and population assessment were collected (Table 190). Overall, catch rates for all sizes of largemouth bass continued to decrease in 2010 (Table 191). Largemouth bass PSD was 24, lower than last year, and the RSD<sub>15</sub> slightly increased from 11 last year to 12 in 2010 (Table 192). The population assessment dropped to "Fair" in 2010 from "Good" in 2009 (Table 193). Electrofishing for largemouth bass in September 2010 was completed to collect relative weight and the index of year class strength at age 0 (Table 194). Relative weights increased in 2010 to an average body condition for largemouth bass (Table 195). CPUE for both age-0 and age  $0 \geq 5.0$  in increased from last year (Table 196). Age 0 CPUE (169.60 fish/hr) was significantly greater than the lake average (113.73 fish/hr), therefore, largemouth bass were not stocked into McNeely Lake in 2010. Currently, McNeely Lake does not contain a population of gizzard shad.

Bluegill and redear sunfish were sampled in May 2010 for length frequency, CPUE, age and growth, age frequency and population assessment (Table 197). Catch rates for bluegill  $\geq 6.0$  in decreased from 2009 (Table 199). The bluegill PSD was 48 compared to 60 in 2009 (Table 198). RSD<sub>8</sub> was 0 in 2010, compared to 0.2 in 2009. Age and growth studies on bluegill showed that they reach 6.0 in between age 2 and 3 (Table 200). The majority (85%) of bluegill collected were age 1 to age 3 (Table 201). The population assessment for bluegill continues to be "Good" (Table 203). Catch rates for redear sunfish declined significantly from 2009 (Table 204). The PSD for redear sunfish was 41 compared to 66 last year, and the RSD<sub>9</sub> decreased to 7 from 23 (Table 198). Age and growth studies indicated good growth rates with redear sunfish reaching 6.0 in between age 1 and 2, 8.0 in between age 2 and 3, and 10.0 in between age 5 and 6 (Table 205). The redear sunfish fishery was rated "Good", a decline from "Excellent" in 2009 (Table 208). Relative weight data for bluegill and redear sunfish were collected in the fall (Table 209). Good body condition was exhibited by redear sunfish and bluegill during the fall of 2010.

#### **Williamstown Lake**

Williamstown Lake was electrofished for largemouth bass population analysis in May 2010. Data for length frequency, CPUE, PSD, age frequency and population assessment were collected (Table 210). Overall, catch rates for all sizes of largemouth bass increased slightly from 2009 (Table 211). Largemouth bass PSD and RSD<sub>15</sub> was 56 and 16, respectively (Table 212). The population assessment was "Fair" in 2010, the same as 2009 (Table 213). Electrofishing for largemouth bass in October 2010 was conducted to collect relative weight and the index of year class strength at age 0 (Table 214). The relative weights indicated average body condition for largemouth bass (Table 215). Year class strength indices significantly increased from last year (Table 216).

#### **Simpson Lake**

Relative abundance and CPUE of largemouth bass collected in the spring are shown in Table 217. All sizes of largemouth bass were represented with good numbers of bass above the 15.0-in size limit. Largemouth bass up to 21.0 in. were collected. Catch rate of largemouth bass essentially remained the same as last year with a catch rate of 112.00 fish/hr in 2010 and 113.50 fish/hr in 2009. Fall electrofishing for length frequency and CPUE of largemouth bass was completed (Table 218).

#### **Lincoln Homestead Lake**

Length frequency, relative abundance, and CPUE of fish collected by electrofishing at Lincoln Homestead Lake in May 2010 are shown in Table 219. Studies show largemouth bass from 4.0 to 17.0 inches in fair numbers. Bluegill over 7.0 in were collected.

**Doe Run Lake**

Length frequency, relative abundance and CPUE of fish collected by electrofishing at Doe Run Lake (Kenton Co.) in April 2010 are shown in Table 220. A successful gizzard shad removal was conducted in January 2006. Fall electrofishing for length frequency and CPUE of largemouth bass and bluegill was completed (Table 221).

**General Butler State Park**

Length frequency and CPUE of largemouth bass collected in April 2010 at General Butler State Lake are presented in Table 222. Largemouth bass were present in fair numbers. Fall electrofishing for length frequency and CPUE of largemouth bass and bluegill was completed (Table 223).

**Leary Lake**

Species composition, length frequency, and CPUE of fishes collected from Leary Lake in May 2010 are presented in Table 224. This Lloyd WMA lake (3a) receives heavy fishing pressure. Studies show largemouth bass from 2.0 to 13.0 inches in fair numbers. These results are similar to last year's results. Bluegill greater than 8.0 in were collected.

**Willisburg Lake**

Relative abundance and CPUE of largemouth bass collected in the spring are shown in Table 225. All sizes of largemouth bass were represented with good numbers of bass above the 12.0-in size limit. Largemouth bass up to 20.0 in were collected. Catch rate of largemouth bass decreased from 131.00 fish/hr in 2009 to 114.00 fish/hr in 2010. Fall electrofishing for length frequency and CPUE of largemouth bass was completed (Table 226).

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body        | Species     | Date | Time (24hr) | Gear  | Weather                            | Water temp. F | Water level       | Secchi (in) | Conditions | Pertinent sampling comments                                    |
|-------------------|-------------|------|-------------|-------|------------------------------------|---------------|-------------------|-------------|------------|----------------------------------------------------------------|
| Herrington        | Crappie     | 3/19 | 1000        | shock |                                    |               | 719.4             |             | good       | good sample                                                    |
|                   |             | 3/23 | 1000        | shock |                                    |               |                   |             | good       | good sample                                                    |
|                   |             | 3/24 | 1000        | shock |                                    |               |                   |             | fair       | good sample                                                    |

### HERRINGTON LAKE ANGLER ATTITUDE SURVEY 2010

(based on 130 surveys)

1. Have you been surveyed this year? Yes - stop survey No – continue
2. Name \_\_\_\_\_ and Phone number \_\_\_\_\_ (Optional)
3. Which species of fish do you fish for at Herrington Lake (**check all that apply**)?  
Crappie **63.1%** Bass **43.8%** Hybrid Striped Bass **21.5%** White Bass **20.8%** Channel Catfish **9.2%** Flathead Catfish **7.7%**  
Bluegill **3.1%**
4. Which one species do you fish for most at Herrington Lake (**check only one**)?  
Crappie **50.0%** Bass **36.4%** Channel Catfish **5.1%** Hybrid Striped Bass **4.2%** Bluegill **2.5%** Flathead Catfish **1.7%**

**-Answer the following questions for each species you fish for – (see question 3)**

#### **Bass Anglers (57 responses)**

5. In general, what level of satisfaction do you have with bass fishing at Herrington Lake?  
Very satisfied **17.5%** Somewhat satisfied **73.7%** Neutral **8.8%** Somewhat dissatisfied **0.0%** Very dissatisfied **0.0%**  
No opinion **0.0%**

5a. If you responded with somewhat or very dissatisfied in question (5) – what is the single most important reason for your dissatisfaction?

**None**

#### **Crappie Anglers (81 responses)**

6. In general, what level of satisfaction do you have with the crappie fishing at Herrington Lake?  
Very satisfied **4.9%** Somewhat satisfied **70.4%** Neutral **11.1%** Somewhat dissatisfied **11.1%** Very dissatisfied **2.5%**

6a. If you responded with somewhat or very dissatisfied in question (10) – what is the single most important reason for your dissatisfaction?

Number of fish **100.0%**

#### **Hybrid Striped Bass Anglers (27 responses)**

7. In general, what level of satisfaction do you have with the bluegill fishing at Herrington Lake?  
Very satisfied **3.7%** Somewhat satisfied **48.1%** Neutral **40.7%** Somewhat dissatisfied **7.4%** Very dissatisfied **0.0%**  
No opinion **0.0%**

7a. If you responded with somewhat or very dissatisfied in question (10) – what is the single most important reason for your dissatisfaction?

Number of fish **100.0%**

#### **White Bass Anglers (27 responses)**

8. In general, what level of satisfaction do you have with the white bass fishing at Herrington Lake?  
Very satisfied **0.0%** Somewhat satisfied **25.9%** Neutral **48.1%** Somewhat dissatisfied **25.9%** Very dissatisfied **0.0%**  
No opinion **0.0%**

8a. If you responded with somewhat or very dissatisfied in question (12) – what is the single most important reason for your dissatisfaction?

Number of fish **100.0%**

#### **Channel catfish Anglers (11 responses)**

9. In general, what level of satisfaction do you have with the channel catfish fishing at Herrington Lake?  
Very satisfied **9.1%** Somewhat satisfied **81.8%** Neutral **0.0%** Somewhat dissatisfied **9.1%** Very dissatisfied **0.0%**  
No opinion **0.0%**

9a. If you responded with somewhat or very dissatisfied in question (12) – what is the single most important reason for your dissatisfaction?

Size of fish 100.0%

**Flathead Catfish Anglers** (10 responses)

10. In general, what level of satisfaction do you have with the flathead catfish fishing at Herrington Lake?

Very satisfied 0.0% Somewhat satisfied 90.0% Neutral 10.0% Somewhat dissatisfied 0.0% Very dissatisfied 0.0%

10a. If you responded with somewhat or very dissatisfied in question (6) – what is the single most important reason for your dissatisfaction?

**None**

All Anglers

11. Would you support or oppose a reduction in the current statewide 30 fish daily crappie creel limit to 20 fish?  
Support 96.8% Oppose 2.4% No opinion 0.8%

12. How many times do you fish Herrington Lake a year?

First Time 4.1% 1 to 4 36.6% 5 to 10 45.5% More than 10 13.8%

13. Are you satisfied with the current size and creel limits on all sport fish at Herrington Lake?

Yes 86.0% No 14.0%

Table 65. Species composition, relative abundance, and CPUE (fish/hr) of black bass collected in 6.0 hours of 15-minute electrofishing runs in Guist Creek Lake, April 2010; numbers in parentheses are standard errors.

| Species         | Inch class |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |     | Total         | CPUE |
|-----------------|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|---------------|------|

Dataset = cfdwrcor.d10

Table 144. Length composition, relative abundance, and CPUE (fish/set-night) of channel catfish at Corinth Lake. Channel catfish were collected using baited, tandem hoop nets (72 hours soak time) that were set on 27 September 2010. Nets were pulled three days after setting them, and 3 sets of tandem nets were used for the sampling event.

| Species         | Inch class |    |    |    |    |    |    |    |    |    | Total | Average per set |
|-----------------|------------|----|----|----|----|----|----|----|----|----|-------|-----------------|

## CORINTH LAKE ANGLER ATTITUDE SURVEY 2010

(Based on 330 surveys)

13 Which species of fish do you fish for at Corinth Lake (check all that apply)?  
Bass 44.8% Crappie 26.1% Bluegill 63.0% Redear sunfish 31.2% Channel catfish 34.5%

13 Which one species do you fish for most at Corinth Lake (check only one)?  
Bass 28.9% Crappie 8.6% Bluegill 40.3% Redear sunfish 8.3% Channel catfish 14.0%

### Bass Anglers

13 What level of satisfaction do you have with bass fishing at Corinth Lake?

Very satisfied 7.6% Somewhat satisfied 43.8% Neutral 30.6% Somewhat dissatisfied 17.4% Very dissatisfied 0.0%  
No opinion 0.7%

3a. If you responded with somewhat or very dissatisfied in question (5) – what is the single most important reason for your dissatisfaction?

Number of fish 80.0% Size of fish 20.0%

### Crappie Anglers

13 What level of satisfaction do you have with the crappie fishing at Corinth Lake?

Very satisfied 8.1% Somewhat satisfied 32.6% Neutral 40.7% Somewhat dissatisfied 18.6% Very dissatisfied 0.0%  
No opinion 0.0%

4a. If you responded with somewhat or very dissatisfied in question (6) – what is the single most important reason for your dissatisfaction?

Number of fish 62.5% Size of fish 37.5%

### Bluegill Anglers

13 What level of satisfaction do you have with the bluegill fishing at Corinth Lake?

Very satisfied 16.0% Somewhat satisfied 43.5% Neutral 22.5% Somewhat dissatisfied 18.0% Very dissatisfied 0.0%  
No opinion 0.0%

5a. If you responded with somewhat or very dissatisfied in question (8) – what is the single most important reason for your dissatisfaction?

Size of fish 82.9% Number of fish 17.1%

### Redear sunfish Anglers

13 What level of satisfaction do you have with the redear sunfish fishing at Corinth Lake?

Very satisfied 12.1% Somewhat satisfied 47.5% Neutral 20.2% Somewhat dissatisfied 19.2% Very dissatisfied 1.0%  
No opinion 0.0%

6a. If you responded with somewhat or very dissatisfied in question (8) – what is the single most important reason for your dissatisfaction?

Number of fish 66.7% Size of fish 33.3%

Catfish Anglers

13 What level of satisfaction do you have with the catfish fishing at Corinth Lake?

Very satisfied 11.0% Somewhat satisfied 50.5% Neutral 26.6% Somewhat dissatisfied 11.9% Very dissatisfied 0.0% No opinion 0.0%

7a. If you responded with somewhat or very dissatisfied in question (9) – what is the single most important reason for your dissatisfaction?

Size of fish 76.9% Number of fish 23.1%

13 Would you support or oppose a reduction in the current statewide 30 fish daily crappie creel limit to 20 fish?

Support 51.1% Oppose 21.8% No Opinion 27.1%

13 How many times do you fish Corinth Lake a year?

First Time 15.3% 1 to 4 33.0% 5 to 10 28.0% More than 10 23.7%

13 Are you satisfied with the current size and creel limits on all sport fish at Corinth Lake?

Yes 92.5% No 7.5%

Table 160. Species composition, relative abundance, and CPUE (fish/hr) of black bass collected in 2.0 hours of 15-minute electrofishing runs in Elmer Davis Lake, April 2010; numbers in parentheses are standard errors.

| Species         | Inch class |    |    |   |    |    |    |     |    |    |    |    |    |    |    |    |    | Total | CPUE |     |                |

Table 187. Length composition, relative abundance, and CPUE (fish/set-night) of channel catfish at Kincaid Lake. Channel catfish were collected using baited, tandem hoop nets (72 hours soak time) that were set on 04 October 2010. Nets were pulled three days after setting them, and 3 sets of tandem nets were used for the sampling event.

## NORTHEASTERN FISHERY DISTRICT

### Project 1: Lake and Tailwaters Fishery Surveys

#### FINDINGS

All sampling conditions can be found in Table 1. This includes dates, temperatures, secchi depths and any other pertinent sampling information during the sampling events.

#### **Cave Run Lake (8,720a)**

##### Muskellunge Sampling

Muskellunge were sampled during 15-18 March for a total of 18 hours (36 - 30 minute runs) within all sections of the lake. A total of 272 (15.11 fish/hr) muskellunge were captured (including observed young of year fish) ranging in size from 11.0 to 45.0 in (Table 2). In the upper section, 57 muskie (9.50 fish/hr) were captured or observed, in the middle section, 73 muskie (12.17 fish/hr) were captured or observed and in the lower section, 142 muskie (23.67 fish/hr) were captured or observed (Table 2). Relative weights ( $W_r$ ) were calculated by length groups from 2003 to 2010 and show fairly consistent  $W_r$  values through that time period (Table 3). Based on the mean  $W_r$  value for the past eight years, declines were observed, though inconsequential at present, in those fish in the  $\leq 20$  and 20.0 - 30.0 inch groups (Table 3). The overall assessment values determined for muskellunge in 2010 remained at a value of 16 ("Good") which is the second highest value since 1995 (Table 4). The assessment for muskellunge on Cave Run Lake includes observations of age-1 fish but no other observations. Management objectives for catches of age 1 fish ( $>2.40$  fish/hr),  $\geq 20.0$  in fish ( $>3.35$  fish/hr),  $\geq 30.0$  in fish ( $>2.54$  fish/hr),  $\geq 36.0$  in fish ( $>1.20$  fish/hr) and  $\geq 40.0$  in fish ( $>0.42$  fish/hr) were all met in 2009 (Table 13).

Beginning in 2010 a new 36.0-in minimum size limit regulation was imposed on muskellunge in Cave Run Lake as well as Buckhorn and Green River lakes. As a result, a research study evaluating the 36.0-in size limit on all three lakes began during 2010. Also as a result of this study, sampling efforts on Cave Run Lake were conducted approximately two weeks earlier than sampling efforts during the last ten years. Muskies stocked during 2010 had their left pectoral fin clipped.

##### Black Bass Sampling (Spring)

For a second year in a row spring black bass sampling was attempted on Cave Run Lake, but high water at this time prevented a quality sample from being obtained. In spite of the lack of sampling during 2010 and 2009, the population assessment of largemouth bass is shown in Table 5. Management objectives for largemouth bass could not be determined for 2010 or 2009.

##### Black Bass Sampling (Fall)

Black bass were sampled on 20 - 22 September for a total of 6 hours (2 hours per section; 12 - 30 minute runs). In 2010, 1,385 black bass were captured; of these 878 (146.33 fish/hr) were largemouth bass, 487 (81.17 fish/hr) were spotted bass and 20 (3.33 fish/hr) were smallmouth bass (Table 6). The majority of the largemouth bass captured came from the upper section of the lake (516 fish; 258.00 fish/hr) while the majority of the spotted bass (260 fish; 130.00 fish/hr) and smallmouth bass (11 fish; 5.50 fish/hr) came from the middle section of the lake (Table 6). Relative weight ( $W_r$ ) values showed the highest condition in the middle section for largemouth bass  $\geq 15.0$  in, but were higher in the upper and lower sections for the 8.0 - 11.9 in fish and the 12.0 - 14.9 in fish, respectively (Table 7). For spotted bass the  $W_r$  values were highest in the middle section for all fish captured, and for smallmouth bass were highest in the middle section for all fish captured (Table 7). Indices of year class strength revealed age 0 (91.67 fish/hr) and age 0  $\geq 5.0$  in (24.67 fish/hr) densities were sufficient enough that largemouth bass stocking was not warranted in 2010 (Table 8).

##### Crappie Trap Netting

During 01 - 05 November, trap nets were set for crappie in the upper portion of the lake. Fifteen nets were set for a total of 60 net-nights (nn) in 2010. A total of 400 crappie were netted; of these, white crappie

made up the majority of the catch (370 fish; 6.17 fish/nn), while only 30 (0.50 fish/nn) black crappie were captured (Table 9). The PSD for white crappie was 38 and for black crappie was 29 while the RSD<sub>10</sub> for white crappie was 13 and for black crappie was 7 (Table 10). In 2010, those fish that were young-of-year, age 1, and age 2 comprised 90.5% of the total catch (Table 11). The overall assessment for white crappie in 2010 rated the population as “Poor” (Table 12). Based on crappie angler attitudes and comments received during the last several years, the population assessment value obtained on Cave Run Lake may be more reflective of sampling limitations and environmental conditions at the time of sampling rather than an indication of total population status. Only two of four management objectives were met during 2010 for white crappie; CPUE of age-0 (>1.88 fish/nn) and CPUE  $\geq$  8.0 in (1.00 fish/nn) (Table 13).

#### Vegetation Sampling

On 05 – 06 July, Cave Run Lake was sampled for aquatic vegetation. Procedures for this sample were modified from the Long Term Resource Monitoring Program Vegetation component (Yin, et. Al, 2000). The sampling included 99 sites that had a water depth of 10 feet or less; of these 99 sites, 90 were randomly chosen and 9 were fixed sites. The randomly chosen sites were subdivided so that 30 sites were in each section of the lake, and all portions of the lake with a water depth of 10 feet or less had an equal chance of being picked. Fixed sites located around the boat ramps were added to the program as a way to better monitor for invasive aquatic vegetation. The sampling protocol divided the types of plants observed into ecological categories based on the plant type. Table 14 shows examples of those vegetation types. Of the 99 sites picked only 97 were sampled (31 in the lower, 31 in the middle and 35 in the upper) of those 97 sites 48.4% were unvegetated, 30.9% had some form of submersed aquatic vegetation, 18.6% had emergent vegetation and 11.3% had algae (Table 15). There were no observations of non-rooted floating vegetation or rooted floating vegetation. Both the lower and upper sections of the lake were dominated by unvegetated sites (48.4% and 54.3%, respectively), while the middle section was dominated by both unvegetated sites and submersed vegetation sites (35.5%; Table 15). Overall there were 16 different plant species observed; of these only 4 were submersed aquatic vegetation, 1 was algae and the remainder was forms of emergent vegetation (Table 16). Overall the most frequent vegetation type was unvegetated sites followed by curly pondweed (*Potamogeton crispus*) and chara (*Chara* spp.; Table 16). For the lower section there were 8 different types of plants observed. The most common type was unvegetated sites followed by curly pondweed then eurasian watermilfoil (*Myriophyllum spicatum*; Table 16). In the middle section, 13 different types of plants were observed. The most common types were a tie between unvegetated sites and curly pondweed sites followed by chara (Table 16). For the upper section there were 11 different types of plants observed. The most common was unvegetated followed by smart weeds (*Polygonum* spp.), and a tie between eurasian watermilfoil, eastern sycamore (*Plantanus occidentalis*) and common buttonbush (*Cephalanthus occidentalis*; Table 16). Overall, on average, plant coverage on vegetated sites was 25%; with the highest densities in the middle unit and the lowest in the upper unit (Table 17). When looked at on an individual plant basis (including the combination of sites with both eurasian watermilfoil and curly pondweed), sites with just curly pondweed were the most dense while sites with eurasian watermilfoil or spiny naiad (*Najas marina*) were the least dense (Table 17).

When compared to the previous years' samples, there were many more unvegetated sites observed in the 2010 sample and this is most likely due to the extended periods of high water in the early part of the year. For 24 days in May, the lake was at least 5 feet above summer pool levels. Considering the densities seen in 2010, it appears that eurasian watermilfoil and spiny naiad may be affected by early season high water or turbidity while curly pondweed is not. Further examination of the natural histories of these plants may show curly pondweed as a late season grower and the others as early season growers lending credence to these observations. The only observed invasive species continues to be eurasian watermilfoil and the dominant submersed aquatic plant continues to be curly pondweed. Anecdotally, the drought experienced in the later part of the summer aided the growth of vegetation especially in the lower and middle sections of the lake. These observations were not included in this vegetation survey as the sampling period was much earlier than this growth.

#### Miscellaneous

In the winter of 2010, around 250 recycled Christmas trees were used to refresh (3 sites) and create (3 sites) 6 fish attractors sites in the lake with assistance from Minor Clark Fish Hatchery staff as well as USFS personnel. During the fall, 2,811 muskellunge which averaged 12.5 in were stocked into the lake.

## **Grayson Lake (1,512a)**

### Black Bass Sampling (Spring)

High water at the time of spring black bass sampling prevented a quality sample from being obtained. In spite of the lack of sampling during 2010, the population assessment for largemouth bass is shown in Table 18. Management objectives for largemouth bass could not be determined for 2010.

### Black Bass Sampling (Fall)

On 13 – 15 September, Grayson Lake was nocturnally sampled for black bass species for a total of 4.5 hours (3- 30-minute runs in each section). In total, 943 fish were captured across all 3 sections. Only largemouth bass and spotted bass were collected and the sample was dominated by largemouth bass (73% of the catch; Table 19). Largemouth bass showed a fairly consistent spread across all the lake sections while spotted bass were highest in the lower section and declined steadily to the upper section (Table 19). Relative weights showed an increase for largemouth bass  $\geq 15.0$  in, declined for those in the 12.0 to 14.9 in range and remained steady for all length groups of spotted bass (Table 20). Examination of the year class strength of largemouth bass showed a dramatic increase in the catches of both age-0 fish and age-0 fish  $\geq 5.0$  in when compared to the mean; these results were used to determine that Grayson Lake did not need to receive supplemental stockings of YOY largemouth bass in 2010 (Table 21).

### Crappie Fall Electrofishing

On 20 October, Grayson Lake was diurnally electrofished for black and white crappie population characteristics. The upper section of the lake continues to be the only section examined. In total, 442 fish were captured in 3.0 hours of sampling. Of these, the majority was white crappie (415 fish or 94%; Table 22). This catch almost doubled the total catch of 2009 (2010: 442 fish, 2009: 217 fish), and demonstrates that capture of crappie within Grayson Lake continues to be extremely variable from year to year. In spite of the increase in catches, the PSD and RSD<sub>10</sub> remained consistent for white crappie (Table 23).

Otoliths were removed from a subsample of both black (27 fish) and white (67 fish) crappie for determination of age characteristics in 2010. Back calculated growth of white crappie showed that on average they reach 8.0 in by their 4<sup>th</sup> year (Table 24); while black crappie take an extra year, reaching 8.0 in in their 5<sup>th</sup> year (Table 25). When these growth rates are applied to the complete catches of white crappie, 71% of our total catch is between 6.0 and 7.0 in or between the ages of 2 and 3 (Table 26). For black crappie, 74% of the catch was between 6.0 and 8.0 in or between the ages of 2 and 4 (Table 27).

The overall assessment for white crappie in Grayson Lake (based on *lake specific* assessment) showed an increase from 10 to 12, but remained “Fair” (Table 28). The scoring of the parameter of age-0 CPUE most likely prevented a further increase from 2009. Management objectives for catches of greater than age-1 fish ( $\geq 87.00$  fish/hr) and catches of greater than 8.0 in fish ( $\geq 20.00$  fish/hr) were met in 2010, but objectives for catches of age-1 ( $\geq 23.00$  fish/hr) and age-0 ( $\geq 9.00$  fish/hr) fishes were not met.

### Vegetation Sampling

On 10 August, Grayson Lake was sampled for aquatic vegetation for the first time. Procedures for this sample were modified from the Long Term Resource Monitoring Program Vegetation Component (Yin, et. Al, 2000). The sampling included 49 sites that had a water depth of 10 feet or less; of these 49 sites, 45 were randomly chosen and 4 were fixed sites. The randomly chosen sites were subdivided so that 15 sites were in each section of the lake, and all portions of the lake with a water depth of 10 foot or less had an equal chance of being picked. Fixed sites were located around the boat ramps and were included in the program as a way to better monitor for invasive aquatic vegetation. The sampling protocol divided the types of plants observed into ecological categories based on the plant type. Table 29 shows examples of those vegetation types. Of the 49 sites picked, only 48 were sampled (15 in the lower, 17 in the middle and 16 in the upper). Of those 48 sites, 50.0% were unvegetated, 35.4% had emergent vegetation, 18.8% had algae and 4.2% had some form of submersed aquatic vegetation (Table 30). There were no observations of non-rooted floating vegetation or rooted floating vegetation. Both the middle and upper sections of the lake were dominated by unvegetated sites (47.1% and 68.8%, respectively), while the lower section was dominated by algae (46.7%; Table 30). Overall there were 26 different plant species observed; of these, only 2 were submersed aquatic vegetation, 1 was algae and the remainder was forms of emergent

vegetation (Table 31). Overall, the most frequent vegetation type was unvegetated sites followed by chara (*Chara* spp.), clover (*Lespedeza* spp.) and common button bush (*Cephalanthus occidentalis*; Table 31). For the lower section there were 14 different types of plants observed. The most common type was chara followed by unvegetated sites and then clover (Table 31). In the middle section 14 different types of plants were observed. The most common types were unvegetated sites followed by clover and button bush (Table 31). For the upper section, there were 12 different types of plants observed. The most common was unvegetated followed by common button bush and a tie between water willow (*Justicia americana*) and stinging nettle (*Urtica dioica*; Table 31).

#### Miscellaneous

In 2010, 15,407 hybrid striped bass were stocked into Grayson Lake with an average length of 2.2 in. We continue to observe these fish within our nocturnal largemouth bass electrofishing. In the fall of 2011, netting of these fish will begin to assess the population.

### **Lake Carnico (114a)**

#### Black Bass Electrofishing (Spring)

On 05 May, the shoreline of Lake Carnico (Nicholas County) was nocturnally electrofished for black bass. A total of 130 (143 in 2009, 54 in 2008, 292 in 2007) largemouth bass were captured ranging in size from 2.0 to 20.0 in long (Table 32). Largemouth bass age frequency is found in Table 33. Population assessments (Table 34) again rated Lake Carnico as a "Fair" largemouth bass fishery. Catch rates by length group are shown in Table 35. PSD and the RSD<sub>15</sub> values compared to past years can be found in Table 36.

#### Bluegill / Redear Sunfish Sampling

On 03 June, the shoreline of Lake Carnico was diurnally electrofished for sunfish species. A total of 1,324 fishes were captured; 1,026 were bluegill, 15 were redear sunfish and the remainder was green sunfish, longear sunfish and hybrid sunfish (Table 37). CPUE for various length groups of bluegill and redear sunfish can be found in Table 38. The PSD remains below the desired level (Table 39). Age and growth for bluegill can be found in Table 40. Age frequencies indicated those bluegill age 1 and age 2 comprised 82% of the total sample and ranged in length from 2.0-4.0 in (Table 41). Age and growth along with age frequency for redear sunfish can be found in Tables 42 and 43, respectively. The overall assessment for the bluegill population remained classified as "Fair" (Table 44).

#### Black Bass Electrofishing (Fall)

On 30 September, the shoreline of Lake Carnico was nocturnally electrofished for black bass. In total, 137 largemouth bass were sampled ranging in size from 2.0 in to 21.0 in (Table 45). Relative weight values (Table 46) remained relatively the same except for those fish in the  $\geq 15.0$  in range which again increased to 98 from past values of 92 in 2009, 79 in 2008, and 91 in 2007.

#### Miscellaneous

The lake received a supplemental stocking of 500 remedial bass during October 2010.

### **Clear Creek Lake (40a)**

#### Black bass electrofishing (Spring)

Could not sample the lake due to an over abundance of aquatic vegetation.

#### Bluegill/redear sunfish electrofishing

On 27 May, the shoreline of Clear Creek Lake (Bath Co.) was diurnally electrofished (4- 7.5-minutes runs) for bluegill and redear sunfish. A total of 690 (206 in 2009, 281 in 2008, 112 in 2007, and 351 in 2006) bluegill and 318 (234 in 2009, 127 in 2008, 130 in 2007, and 94 in 2006) redear sunfish were collected (Table 47). Table 48 shows the CPUE for each length group of bluegill and redear sunfish collected. Age-

1 and age-2 fish represented 96% (84% in 2009) of the total bluegill catch and ranged in size from 1.0 to 4.9 in long (Table 49). Age-2 and age-3 fish accounted for 95% of the total redear sunfish catch (Table 50). The PSD value for bluegill fell below the desirable range (Table 51). The population assessment rated the bluegill fishery as "Poor" (Table 52). This population has been rated "Good" since 2006 and has been in decline since the aquatic vegetation (Eurasian watermilfoil) has increased. The population assessment rated the redear sunfish fishery as "Poor" (Table 53).

#### Black bass electrofishing (Fall)

Could not sample the lake due to an over-abundance of aquatic vegetation.

### **Greenbo Lake (181a)**

#### Black bass electrofishing (Spring)

The shoreline of Greenbo Lake (Greenup Co.) was nocturnally electrofished on 29 April. A total of 336 largemouth bass were collected resulting in a CPUE of 224.00 fish/hr (Table 54). Of the total numbers of largemouth bass collected (336), only 7 stocked fish were found, comprising 2.0% of the catch (Table 55). This was also the case during 2009 where only 7 stocked fish were captured (925 were stocked in the fall of 2007 and 2,715 were stocked in 2008). Catch rates for largemouth bass by length group can be found in Table 56. For comparison purposes, low catch rates experienced in 2008 may be attributed to a malfunctioning electrofishing boat. Catch rates exceeded the management objectives specified in the lake management plan for all length group categories: 12.0 – 14.9 in bass (objective =  $\geq 40.00$  fish/hr, actual = 45.33 fish/hr),  $\geq 15.0$  in bass (objective = 10.00 fish/hr, actual = 13.33 fish/hr),  $\geq 20.0$  in bass (objective = 2.00 fish/hr, actual = 2.00 fish/hr). Largemouth bass PSD remained within the desired range with a value in 2010 of 40 (2009 = 53, 2008 = 51, 2007 = 46, 2006 = 51, 2005 = 41; Table 57). The age frequency for largemouth bass is shown in Table 58. Electrofishing catch rates for each age of largemouth bass from 2000 through 2010 are shown in Table 59. The population assessment rated the bass fishery as "Fair" (Table 60).

#### Bluegill/redear sunfish electrofishing (Spring)

Daytime electrofishing for bluegill and redear sunfish was conducted on 25 May. A total of 1,238 bluegill and 35 redear sunfish were collected (Table 61). Of the total number of bluegill collected, 1001 were  $\leq 3.0$  in. Catch rates by length group of bluegill and redear sunfish can be found in Table 62. Bluegill PSD was 34 which showed a dramatic increase from 2009 (17), 2008 (19), 2007 (22) and 2006 (26; Table 63). Age frequency for bluegill is shown in Table 64. The population assessment rated the bluegill fishery as "Excellent" (Table 65). Only 35 redear sunfish (ranging in size from 1.0-12.0 in) were sampled in 2010 compared to 5 in 2009, 19 in 2008 and 30 in 2007. Too few redear sunfish were collected to make an accurate population assessment. From 2003-2005, 181,500 1.0-in redear sunfish were stocked into the lake.

#### Black bass electrofishing (Fall)

On 16 September, the shoreline of Greenbo Lake was nocturnally electrofished for largemouth bass relative weights and length frequencies. A total of 196 largemouth bass were collected in 1.5 hours of electrofishing (6-15 minute runs; Table 66). Relative weight values compared to past years can be found in Table 67. Largemouth bass indices of year class strength at age 0 and age 1 are found in Table 68. Due to these indices, Greenbo Lake was stocked with 2,724 YOY largemouth bass that averaged 4.9 inches in length in the fall of 2010. Poor spawning success during 2008 and 2007 also warranted the supplemental stocking of 3.0-5.0 in bass (2,715 in 2008 and 925 in 2007).

#### Channel Catfish Tandem Hoop Net

From 18-21 October, three tandem hoop nets sets (3-hoop nets per set) were placed in the lake to sample the channel catfish population. The nets were set at depths ranging from 7-14 feet and yielded a total of 18 channel catfish which ranged in size from 8.0-22.0 in (Table 69). Otoliths were used for age determination

on 16 of the 18 fish. The majority of those were 1+ year old (83%; ranging in size from 8.0 to 10.0 in); however, one 2+ year old fish (14.0 in class), one 4+ year old fish (19.0 in class) and one 7+ year old fish (22.0 in class) were also captured.

#### Creel Survey

A creel survey was conducted at Greenbo Lake from 05 March – 31 October. This survey consisted mainly of a fixed access point survey with a period approximating an hour where the clerk interviewed anglers from a boat after the count period was completed. A total of 7,575 fishing trips and 23,532 angler hours were logged during 2010 which was down significantly from the last time a creel was run during 1990 (27,344 trips and 123,491 angler hours; Table 70). Likewise the catch and harvest rates were lower than that recorded from the 1990 creel survey (data from 1990 was included not so much for comparison but for prosperity sake). The majority of the anglers were males, “still” fishing followed by “casting” from the bank. Table 71 shows the majority of fishing trips were made for rainbow trout (37.52%), followed by black bass (18.90%), panfish (18.01% and “anything” (15.53%). The most successful anglers were those fishing for crappie (53.33%), rainbow trout (38.04%) and panfish (24.22%; Table 71). Black bass anglers were the least successful of all anglers at 6.87% success. Of the 831 largemouth bass caught over the legal size limit of 12.0 in, 309 (37%) were harvested (Table 72). The majority of the largemouth bass were caught in June followed by May and April (Table 73) while the majority of the rainbow trout (87%) were caught in March (Table 74). Monthly angling success values for panfish and channel catfish can be found in Tables 75 and 76 respectively.

#### Angler Attitude Survey

In conjunction with the creel survey anglers were asked several additional questions (Table 77). Anglers were only asked these questions once during the year. Findings from this questionnaire revealed that the majority of the anglers fished for largemouth bass (40.0%), sunfish (38.7%) followed by rainbow trout (30.6%) and channel catfish (18.2%). Of the bass anglers, only 40.4% were very or somewhat satisfied with bass fishing at the lake, however 47.5% were neutral leaving only 12.1% of the anglers who were either somewhat, very dissatisfied, or had no opinion. The majority of those unsatisfied were unhappy with the size number of the fish they caught (100%). Of the sunfish anglers 50.0% were either somewhat or very satisfied and 3.2% were somewhat or very dissatisfied. The majority of the anglers (98.1%) were satisfied with the current regulations on Greenbo Lake.

#### Miscellaneous

Grass carp are still being observed and one was collected during routine sampling in the spring. The grass carp were stocked in 1989. During the year, 4,255 channel catfish and 15,000 rainbow trout were stocked.

### **Mill Creek Lake (41a)**

#### Black bass electrofishing (Spring)

On 28 April, the shoreline of Mill Creek Lake (Powell/Wolfe Co.) was nocturnally electrofished (1 hour; 4-15-minute runs) for black bass species. In total, 161 largemouth bass were captured ranging in size from 2.0 to 20.0 in (Table 78). This showed a marked increase from the 2009 sample of 117 fish and in fact was only second in total sample to 2006 when 182 total fish were captured (Table 79). Increases were observed in the fish less than 8.0 in and 8.0 – 12.0 in (Table 79). PSD and RSD<sub>15</sub> values remained relatively unchanged as they have for the last several years (Table 80). The overall assessment was down from 2009 to a 10 and is rated as “Fair” (Table 81). Management objectives for catches of fish greater than 15.0 in ( $\geq 5.00$  fish/hr) and greater than 20.0 in ( $\geq 1.00$  fish/hr) were both met this year, but the objectives for catches of age-1 fish ( $\geq 15.00$  fish/hr) and fish between 12.0 and 14.9 in ( $\geq 20.00$  fish/hr) were not met (Table 90).

#### Sunfish electrofishing

On 26 May, Mill Creek Lake was diurnally electrofished (1 hour; 4-15-minute runs) for sunfish species. The majority of this sample was bluegill (453 fish), followed by green sunfish (87 fish), longear sunfish (69 fish) and hybrid sunfish (1 fish) for a total of 610 fishes (Table 82). While the overall catch has dropped from 2009, this could be attributed to the drop in the bluegill less than 3.0 in, which show incredible variability over the years (Table 83). Both PSD and RSD<sub>8</sub> values have increased since 2009 (Table 84).

Otoliths were removed from a subsample of 90 bluegill in order to determine growth rates. Back calculated growths of those fish aged showed that on average bluegill reach 8.0 in by their 4<sup>th</sup> or 5<sup>th</sup> year (quickest to 8.0 in was 3 years and longest was 5; Table 85). As is typical of a normal bluegill population, the majority of the fish were below 3.0 in and 1 to 2 years old (Table 86). In terms of the assessment, the mean length at age-2 dropped almost 0.5 in since the last time sunfish were aged; however, this did not affect the scoring of this category. The number of years to reach 6.0 in did not change since the last time the sunfish were aged. The overall assessment has increased from 2007 – 2009 to a score of 10, but remains rated as “Fair” (Table 87). Management objectives for catches of bluegill greater than 8.0 in ( $\geq 5.00$  fish/hr) were met, but objectives for catches of bluegill greater than 6.0 in ( $\geq 40.00$  fish/hr) were not met (Table 90).

#### Black bass electrofishing (Fall)

On 28 September, Mill Creek Lake was nocturnally electrofished (1 hour; 4- 15-minute runs) for assessment of relative weights of black bass. Overall, 145 largemouth bass were sampled ranging in size from 2.0 – 18.0 in (Table 88). The relative weights have remained relatively unchanged since 2007 (Table 89).

#### Miscellaneous

Mill Creek was again stocked with 5,500 rainbow trout and around 1,000 channel catfish. Aquatic vegetation was observed in high densities during the fall black bass sampling. While small amounts of this vegetation would no doubt be beneficial to the fisheries of this lake, the extreme clarity of the lake may allow it to expand beyond the realm of benefit. The vegetation will continue to be monitored while conducting our routine sampling.

### **Lake Reba (76a)**

#### Black bass electrofishing (Spring)

On 26 April, the shoreline of Lake Reba (Madison Co.) was nocturnally electrofished (1.5 hours; 6- 15-minute runs) for black bass population assessment. In total, 369 largemouth bass were captured ranging in size from 2.0 – 20.0 in (Table 91). Of these fish, 56 were stocked in either 2008 or 2009 as part of the largemouth bass stocking initiative representing 15% of the total catch. These fish fell into 2 very distinct age categories with 50 being age-1 fish ranging in size from 4.0 – 5.0 in and 6 being age-2 fish ranging in size from 8.0 – 9.0 in (Table 92). It is unknown if age-1 stocked fish were more prevalent due to natural reasons or the increased stocking rate implemented in 2009. Most likely it is due to the increased stocking rate as only 9 age-1 fish were captured in 2009. Overall, the 2010 catch rates were down around 150.00 fish/hr from the 2009 sample but these drops were not outside the average observed from 1999 – 2009 (Table 93). PSD and RSD<sub>15</sub> were relatively unchanged and did not differ from the 2000 – 2009 mean (Table 94). Otoliths were collected from a subsample of 100 largemouth bass for determination of age and growth characteristics. Back calculated growths indicated that on average, largemouth bass in Lake Reba reach 12.0 in by their 4<sup>th</sup> year, but as early as their 3<sup>rd</sup> year (Table 95). Age frequency showed that the majority of the fish (around 75%) fall within 6.0 to 12.0 in and 2 to 4 years old (Table 96). The parameters of the assessment affected by the age and growth characteristics were fairly consistent with the last time aging was conducted. The overall assessment dropped one point but remained classified as “Good” (Table 97). Management objectives for catches of 12.0 – 14.9 in ( $\geq 40.00$  fish/hr) and greater than 20.0 in ( $\geq 0.50$  fish/hr) fish were met in 2010, but objectives for catches of age-1 ( $\geq 125.00$  fish/hr) and  $\geq 15.0$  in ( $\geq 11.00$  fish/hr) fish were not met (Table 108).

#### Sunfish electrofishing

On 03 June, the lake was diurnally electrofished (1.2 hours; 10- 7.5-minute runs) for assessment of the sunfish populations. In total, 1439 fish were captured. This sample was dominated by bluegill (1139 fish) followed by redear sunfish (181 fish), warmouth (89 fish), green sunfish (20 fish) and hybrid sunfish (10 fish; Table 98). The catch of bluegill increased from the sample collected in 2009, especially in the 3.0 – 5.9 in length group (Table 99). With these increases in the smaller sized fish, there was a drop observed in the PSD values, but this drop is still not outside the confidence interval ranges for previous years (Table 100). Furthermore, not enough larger sized fish were sampled to calculate an RSD<sub>8</sub> value again this year. The population assessment remained stationary at a value of 7 which is classified as “Fair” (Table 101).

The catch rates of redear sunfish took a major drop in 2010 when compared to 2009; however, these catch rates appear to be variable throughout the years (Table 102). With a major drop in the smaller sized fish, this had the effect of increasing the PSD but not outside the range of the 95% confidence intervals (Table 103). The population assessment for redear sunfish within Lake Reba increased a point to 5 but is still classified as "Poor" (Table 104). The major detriment to the assessment values for bluegill and redear sunfish is the catch rates of the larger fish ( $\geq 8.0$  in for bluegill and  $\geq 10.0$  in for redear sunfish) which has never been higher than 0 since the lake was restructured. Management objectives for catches of greater than 6.0 in ( $\geq 75.00$  fish/hr) and greater than 8.0 in ( $\geq 1.00$  fish/hr) bluegill were not met (Table 108).

#### Black bass electrofishing (Fall)

On 23 September, the lake was nocturnally electrofished (1.5 hours; 6- 15-minute runs) for assessment of the age-0 class strength and relative weights. Overall, 431 largemouth bass were sampled ranging in size from 2.0 – 19.0 in (Table 105). Relative weights were unchanged (Table 106) as were the indices of year class strength (Table 107). Because the indices were unchanged, the lake was once again stocked with 1,224 YOY largemouth bass that averaged 4.9 inches in length in the fall of 2010.

#### Miscellaneous

Lake Reba was stocked with around 300 grass carp in the spring and spraying of the lake continued for the entire summer in order to control the overabundance of aquatic vegetation and algae within the lake.

### **Rebel Trace Lake (19a)**

#### Black bass electrofishing (Spring)

Could not sample the lake due to an over abundance of aquatic vegetation.

#### Bluegill/redear sunfish electrofishing

On 02 June, Rebel Trace Lake (Menifee Co.) was diurnally electrofished for sunfish. Length frequency of sunfish collected is found in Table 109 and CPUE for selected length groups of bluegill and redear sunfish are presented in Table 110. The most notable increase in CPUE was for those fish in the 6.0 – 7.9 and  $\geq 8.0$  in length groups. The bluegill PSD value of 37 (13 in 2009 and 5 in 2008) ascended into the desirable range (Table 111). Age frequencies are found for bluegill and redear sunfish in Tables 112 and 113, respectively. The population assessment rated the bluegill fishery as "Good" (Table 114) and the redear sunfish fishery as "Good" (Table 115).

#### Black bass electrofishing (Fall)

For the fourth consecutive year, fall sampling for largemouth bass could not be accomplished due to the extensive coverage of aquatic vegetation. Eurasian watermilfoil was the dominant species during 2007-2009, however during 2010, watermilfoil densities decreased measurably and watershield had increased in abundance. Approximately 75 surplus grass carp from Minor Clark Fish Hatchery have been stocked (2007-2008) in attempts to remedy the watermilfoil situation. Whether the disappearance of the watermilfoil can be attributed to grass carp or high water experienced during the spring is unknown. Approximately 33% of the shoreline around this 19-acre lake can no longer be sampled due to increased sediment loading. Rebel Trace was originally built for flood control and sediment retention and is fulfilling this purpose.

### **Smoky Valley Lake (36a)**

#### Black bass electrofishing (Spring)

High water and heavy turbidity during the spring prevented a sample of Smoky Valley Lake at its traditional time. Fish were sampled concurrently with the spring sunfish sample on 02 June. Not doubt, any differences observed were most likely due to this difference in sampling time. In total, 113 largemouth bass ranging in size from 3.0 – 17.0 in were sampled (Table 116). Catches by length group and PSD values

both show drops over previous years' samples (Table 117 and Table 118, respectively). Fish were collected this year, in spite of the difference in sampling time, so we could obtain age and growth information in order to continue to assess the current "No Minimum Size Limit" regulation. Otoliths were collected from a subsample of 86 largemouth bass. Back calculated lengths show no change from the 2007 aging of the largemouth bass. It still takes 6 years for a largemouth bass to reach 12.0 in (Table 119). It takes almost 2 years longer to reach 12.0 in and the mean length at age-3 is 2.0 in smaller than largemouth bass at Lake Reba. Age frequencies show that the production of fish is still good, but the growth to larger sizes is slow (Table 120). Comparatively, a 5 year old fish at Lake Reba is 15.0+ in long; while at Smoky Valley is 11.0 in. The overall assessment of the largemouth fishery at Smoky Valley is "Poor" (Table 121). Management objectives for catches of age-1 fish ( $\geq 30.00$  fish/hr) were met in 2010, but objectives for catches of 12.0 – 14.9 in ( $\geq 50.00$  fish/hr),  $\geq 15.0$  in ( $\geq 2.00$  fish/hr) and  $\geq 20.0$  in ( $\geq 1.00$  fish/hr) fish were not met (Table 128).

#### Sunfish electrofishing

On 02 June, Smoky Valley Lake was diurnally electrofished (56.67 minutes; 3- 15-minute runs and 1- 11.67-minute run) for sunfish species. In total, 465 fishes were collected. This population was dominated by bluegill (384 fish), followed by green sunfish (59 fish), longear sunfish (19 fish) and hybrid sunfish (3 fish; Table 122). Catches by length group for bluegill overall were pretty steady when compared to previous years (Table 123). When examined by individual length groups, there were some increases observed in the less than 3.0 in and the 6.0 to 7.9 in groups and a decrease in the 3.0 to 5.9 in group, but none of these changes were statistically significant. PSD and RSD<sub>8</sub> appear to remain unchanged and excluding the high value in 2008 appear to be within the limits of all previous years (Table 124). The overall assessment remained as "Fair" (Table 125). Management objectives for catches of bluegill  $\geq 6.0$  in ( $\geq 40.00$  fish/hr) and  $\geq 8.0$  in ( $\geq 2.00$  fish/hr) were not met in 2010 (Table 128).

#### Black bass electrofishing (Fall)

On 27 September, the lake was nocturnally electrofished (1.0 hour; 4- 15-minute runs) for black bass. In total, 257 largemouth bass were captured ranging in size from 2.0 to 14.0 in (Table 126). Relative weight indices were down from previous years to 81 and 82 for the 8.0 to 11.9 in and 12.0 to 14.9 in length groups, respectively (Table 127). Management objectives for relative weights ( $> 90.0$ ) were not met for any of the length groups (8.0 – 11.9 in, 12.0 – 14.9 in and  $\geq 15.0$  in; Table 127).

### **Lake Wilgreen (169a)**

#### Black bass electrofishing (Spring)

On the 27 April, the shoreline of Lake Wilgreen (Madison Co.) was nocturnally electrofished (1.5 hours; 6- 15-minute runs) for black bass. In total, 340 largemouth bass ranging in size from 2.0 to 22.0 in were captured (Table 129). This catch was not significantly different from the 2009 sample but was dramatically lower than the 10 year mean (1999 – 2009; Table 130). This trend was echoed in the fish less than 8.0 in and the 8.0 to 11.9 in fish, was less dramatic in the fish between 12.0 and 14.9 in and did not occur in the fish over 15.0 and 20.0 in (Table 130). PSD and RSD<sub>15</sub> did not show any deviation over the last 3 years (2008 – 2010) but were drastically higher than the mean of the last several years (Table 131). The overall assessment for Lake Wilgreen in 2010 was "Good" (Table 132). However, the decline of the catches of the smaller size ranges of fish could be the result of the increases in the population size of the gizzard shad and could be cause for concern with the largemouth bass fishery moving forward. Management objectives for catches of fish  $\geq 15.0$  in ( $\geq 10.00$  fish/hr) and  $\geq 20.0$  in ( $\geq 1.00$  fish/hr) were met in 2010, but were not met for catches of age-1 fish ( $\geq 30.00$  fish/hr), and fish in the 12.0 to 14.9 in ( $\geq 75.00$  fish/hr) range (Table 139).

#### Sunfish electrofishing

On 08 June, the lake was diurnally electrofished (1.25 hours; 10- 7.5-minute runs) for sunfish species. In total, 767 fish were captured. The majority of the fish were bluegill (606) followed by green sunfish (114), redear sunfish (38) and warmouth (9; Table 133). Overall catches of bluegill and redear sunfish were down in all length groups from the mean (2002 – 2009) with the exception of the bluegill in the 3.0 to 5.9 in length group (Table 134). PSD and RSD values for both species were also down in 2010 (Table 135).

Overall the assessment for bluegill in 2010 was down from "Good" to "Fair" (Table 136). Declines in the populations of bluegill and redear sunfish are most likely the result of direct competition with gizzard shad. Management objectives for the catches of  $\geq 6.0$  in ( $\geq 90.00$  fish/hr) and  $\geq 8.0$  in ( $\geq 1.00$  fish/hr) bluegill were not met in 2010 (Table 139)

#### Black bass electrofishing (Fall)

On 27 September, the lake was nocturnally electrofished (1.5 hours; 6- 15-minute runs) for black bass species. In total, 645 largemouth bass were captured ranging in size from 3.0 to 19.0 in (Table 137). Relative weights for fish over 15.0 in remain in the acceptable range, but are on the lower end of acceptable for fish between 12.0 and 14.9 in and are below acceptable for smaller sunfish (Table 138). Most likely, the high weights are the result of increased forage for the larger sized bass and the low weights for the smaller fish are the result of the increased competition in those smaller classes due to a decline in suitable sized forage for those sized fish. Management objectives for relative weights ( $> 90.0$ ) for the  $\geq 15.0$  in and 12.0 to 14.9 in ranges were both met in 2010, but for the fish between 8.0 and 11.9 in, the goal was not met (Table 139).

#### Miscellaneous

Lake Wilgreen was stocked with 300 larger sized blue catfish again in 2010. This lake was added to the regular stocking list for the 2011 season. Electrofishing for these fish was attempted in 2010 with little success. It will be continued in 2011 for further evaluation of the population.

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body       | Species | Date (2008)                                            | Time (24hr) | Gear     | Weather       | Water Temp (°F) | Water level | Secchi (in) | Conditions | Pertinent sampling comments*              |

Table 77: Angler attitude survey carried out in conjunction with 2010 creel survey on Greenbo Lake.

3. Which species of fish do you fish for at Greenbo Lake?

**Bass** = 40.0%; **Sunfish** = 38.7%; **Trout** = 30.6%; **Catfish** = 18.2%; **Other** = 0.8% (Crappie, Anything)

4. Which species do you fish for most often at Greenbo Lake?

**Bass** = 34.2%; **Sunfish** = 31.2%; **Trout** = 22.7%; **Catfish** = 11.7%

**Bass Anglers**

5. What level of satisfaction do you have with bass fishing at Greenbo Lake?

|                                 |                                     |                      |
|---------------------------------|-------------------------------------|----------------------|
| <b>Very Satisfied</b> = 13.6%   | <b>Somewhat Satisfied</b> = 26.8%   | <b>Total</b> = 40.4% |
| <b>Very Dissatisfied</b> = 1.5% | <b>Somewhat Dissatisfied</b> = 6.1% | <b>Total</b> = 7.6%  |
| <b>Neutral</b> = 47.5%          | <b>No Opinion</b> = 4.5%            |                      |

5a. If you responded with somewhat or very dissatisfied in question 5 - what is the single most important reason for your dissatisfaction?

\*Note: These numbers are from 8 of the 17 dissatisfied anglers **ONLY**

**Number of fish** 100.0%

**Catfish Anglers**

6. What level of satisfaction do you have with catfish fishing at Greenbo Lake?

|                               |                                     |                      |
|-------------------------------|-------------------------------------|----------------------|
| <b>Very Satisfied</b> = 8.9%  | <b>Somewhat Satisfied</b> = 54.4%   | <b>Total</b> = 63.3% |
| <b>Very Dissatisfied</b> = 0% | <b>Somewhat Dissatisfied</b> = 7.6% | <b>Total</b> = 7.6%  |
| <b>Neutral</b> = 29.1%        | <b>No Opinion</b> = 0%              |                      |

6a. If you responded with somewhat or very dissatisfied in question 6 - what is the single most important reason for your dissatisfaction?

\*Note: These numbers are from 1 of the 5 dissatisfied anglers **ONLY**

**Size of fish** 100.0%

**Sunfish Anglers**

7. What level of satisfaction do you have with sunfish fishing at Greenbo Lake?

|                                 |                                     |                      |
|---------------------------------|-------------------------------------|----------------------|
| <b>Very Satisfied</b> = 11.6%   | <b>Somewhat Satisfied</b> = 38.4%   | <b>Total</b> = 50.0% |
| <b>Very Dissatisfied</b> = 1.1% | <b>Somewhat Dissatisfied</b> = 2.1% | <b>Total</b> = 3.2%  |
| <b>Neutral</b> = 42.1%          | <b>No Opinion</b> = 4.7%            |                      |

7a. If you responded with somewhat or very dissatisfied in question 5 - what is the single most important reason for your dissatisfaction?

\*Note: These numbers are from 5 of the 6 dissatisfied anglers **ONLY**

**Number of fish** 40.0%  
**Size of fish** 60.0%

**Trout Anglers**

8. What level of satisfaction do you have with trout fishing at Greenbo Lake?

|                                 |                                     |                      |
|---------------------------------|-------------------------------------|----------------------|
| <b>Very Satisfied</b> = 31.9%   | <b>Somewhat Satisfied</b> = 43.8%   | <b>Total</b> = 75.7% |
| <b>Very Dissatisfied</b> = 0.0% | <b>Somewhat Dissatisfied</b> = 2.1% | <b>Total</b> = 2.1%  |
| <b>Neutral</b> = 20.1%          | <b>No Opinion</b> = 2.1%            |                      |

8a. If you responded with somewhat or very dissatisfied in question 6 - what is the single most important reason for your dissatisfaction?

*\*Note: These was only one dissatisfied angler who did no respond to this question*

**All Anglers**

9. How many times do you fish Greenbo Lake a year?

**First time = 14.0%**      **1 to 4 = 18.2%**      **5 to 10 = 21.6%**      **More than 10 = 46.2%**

10. Are you satisfied with the current size and creel limits on all sport fish at Greenbo Lake?

**Yes = 98.1%**      **No = 1.9%**

10a. If not, which species are you dissatisfied with and what size and creel limits would you prefer?

*\*Note: numbers below are percentages ONLY from the anglers that answered no in number 10- 1.9%*

**Sunfish creel limit changes: 20 (33.3%); 25 (33.3%); no limit (33.3%), based on 3 anglers**

**Catfish size limit changes: 12.0 inch (100%) based on 2 anglers**

**Largemouth bass creel limit changes: 2 (100%) based on 1 angler**

*Unsupervised comments in the "General Comments" section of the angler attitude survey (edited)*

- Don't change the 12" size limit on largemouth bass.
- Several requests to remove grass carp
- Several requests to remove trout
- Better access to the dam, trail around entire lake, steps to the dam
- Add vegetation
- Catfish are too small
- More bluegill, increase creel limit,
- Too many bluegill, overpopulated
- Keep all bluegill they catch
- Enforce laws
- Make them bite
- Need more crappie
- Trail around lake

Table 78. Length frequency and CPUE (fish/hr) for largemouth bass collected in 1.0 hour of nocturnal electrofishing (4- 15-minute runs) at Mill Creek Lake (Powell/Wolfe Co.) on 28 April 2010.

## SOUTHEASTERN FISHERY DISTRICT

### Project 1: Lake and Tailwater Fishery Surveys

#### FINDINGS

Conditions encountered during sampling at southeastern district lakes are listed in Table 1.

#### **Lake Cumberland (37,680 acres)**

Beginning in January 2007, water levels were reduced to 680 msl to make repairs to Wolf Creek Dam. As a result, many sampling locations that were used prior to 2007 were dry and unable to be sampled. Samples from 2007-2010 were conducted in areas further downstream in the embayments. Therefore, any comparisons of the 2007-2010 data to previous results should be interpreted accordingly.

#### Black Bass Sampling (Spring)

Nocturnal electrofishing studies were conducted at Wolf Creek dam, and in the Harmon Creek, Fishing Creek, and Lily Creek embayments of Lake Cumberland during April 2010 to assess the black bass populations. The length-frequency and catch-per-unit-effort (CPUE) of the three black bass species collected in each area is shown in Table 2. The catch-per-hour (by area and length group) of the three black bass species are shown in Tables 3-6. Table 7 compares the catch-per-hour by length group of black bass in Lake Cumberland to other SEFD lakes sampled in 2010.

Largemouth bass catch rates met or exceeded the four CPUE management objectives (Table 8). The spotted bass population met two out of four catch rate management objectives, with the CPUE of age-1 spotted bass and the CPUE of 11.0-13.9 in spotted bass both exceeding the objectives (Table 9). The smallmouth bass population met two out of four catch rate management objectives (Table 10). The catch rates of  $\geq 14.0$  in (3.67 fish/hr) and  $\geq 17.0$  in (2.33 fish/hr) smallmouth bass met the management objectives.

Largemouth bass and smallmouth bass exhibited good size structure, with a PSD value of 51 and an  $RSD_{15}$  value of 22 for largemouth bass and a PSD value of 57 and an  $RSD_{14}$  value of 43 for smallmouth bass (Table 11). Spotted bass had a moderate size structure, with a PSD value of 27 and an  $RSD_{14}$  value of 2 (Table 11). Table 12 compares the size structure values of black bass populations in Lake Cumberland to other SEFD lakes sampled in 2010.

Age-growth data from smallmouth bass collected in 2010 is shown in Table 13. Age-2 and age-3 smallmouth bass comprised 61% of the smallmouth bass catch (Table 14). The smallmouth bass assessment score was 16 (rating=good; Table 15).

#### Black Bass Sampling (Fall)

Nocturnal electrofishing was conducted in the Fishing Creek embayment during September to index the largemouth bass year class strength (Tables 16 and 17). The CPUE of age-0 largemouth bass was higher in 2010 than 2009. Table 18 compares the CPUE of age-0 largemouth bass in Lake Cumberland to other SEFD lakes sampled in fall 2010. Relative weight ( $W_r$ ) values for largemouth bass and spotted bass collected during September sampling are shown in Table 19. Table 20 compares  $W_r$  values for black bass in Lake Cumberland to other SEFD lakes sampled in fall 2010.

#### Walleye and White Bass Sampling

Gill nets were used in November 2010 to evaluate the walleye and white bass populations in the Jamestown/Bugwood, Conley Bottom, and Watisboro/Burnside areas of Lake Cumberland. A total of 135 walleye were captured in 32 net-nights for a catch rate of 4.22 fish/net-night. Length frequency and CPUE of walleye is shown in Table 21. Walleye ranged from 9.0-20.0 in with the mode being the 15.0 in class (34 fish). None of the catch rate management objectives for walleye were met (Table 22). Age-growth

data for male and female walleye are shown in Tables 23 and 24, respectively. The age-growth for both sexes combined is shown in Table 25. Six year-classes were represented in the catch, with the 2009 year class (age 1; 46%) being most abundant (Table 26). Mean length of age 2+ walleye at capture (17.6 in) did not meet the growth objective of 18.0 in (Table 27). Growth rates for walleye have declined over the last several years (Table 22). The walleye assessment score was 8 (rating=fair; Table 27). The assessment score in 2010 was the lowest score for walleye at Lake Cumberland, due in large part to the low CPUE of the  $\geq 20.0$  in fish (Table 22). Relative weight (Wr) values for walleye are shown in Table 28.

A total of 183 white bass were captured in 32 net-nights for a catch rate of 5.72 fish/net-night. Length frequency and CPUE of white bass is shown in Table 21. White bass ranged from 7.0-14.0 in with the mode being the 7.0 in class (70 fish). Age-growth data for white bass is shown in Table 29. Three year-classes were represented in the catch, with the 2010 year class (age 0; 81%) being most abundant (Table 30). The white bass assessment score was 7 (rating=fair; Table 31). Relative weight (Wr) values for white bass are shown in Table 32.

Striped bass were also recorded during walleye gill netting. Thirty-two net-nights captured 300 striped bass for a catch rate of 9.38 fish/net-night. Length-frequency and CPUE of striped bass are shown in Table 21. Striped bass ranged from 8.0 to 28.0 in with the mode being the 17.0 in class (75 fish). The age-growth data for striped bass collected during 2010 is shown in Table 33. Six year-classes were represented in the catch (Table 34). The 2009 (age 1) year class was the most abundant (64%) year class collected, which coincided with the increased (pulsed) stocking rate of 10.00 fish/acre in 2009. Relative weight (Wr) values were adequate for striped bass  $< 20.0$  in, but condition values decreased as fish grew larger (Table 35). Warm water temperatures and decreased dissolved oxygen levels in the lake during 2010 may have affected the growth and condition of the striped bass.

### **Laurel River Lake (6,060 acres)**

#### Black Bass Sampling (Spring)

Nocturnal electrofishing sampling was conducted during April and May 2010 to assess the black bass population in Laurel River Lake. Electrofishing was conducted in four areas of the lake: 1) dam, 2) Spruce Creek, 3) Laurel River arm, and 4) upper Craigs Creek. Length-frequency and CPUE of the three black bass species collected in each area is shown in Table 36. The catch-per-hour (by area and length group) of the three black bass species is shown in Tables 37-40. Table 7 compares the catch-per-hour by length group of black bass in Laurel River Lake to other SEFD lakes sampled in 2010.

Although the largemouth bass population met three of the four catch rate objectives, the CPUE of age-1 largemouth bass failed to meet the management objective (Table 41). Spotted bass met two of the four catch rate management objectives, with the catch rates of 11.0-13.9 in fish (9.00 fish/hr) and the CPUE of  $\geq 14.0$  in (4.83 fish/hr) exceeding the management objectives (Table 42). The smallmouth bass population met three of the four management objectives, with the CPUE of 11.0-13.9 in fish (0.67 fish/hr) failing to meet the management objective (Table 43).

Largemouth and smallmouth bass exhibited excellent size structure, with largemouth bass having a PSD value of 57 and an  $RSD_{15}$  value of 29, and smallmouth bass had a PSD value of 51 and an  $RSD_{14}$  value of 41 (Table 44). Spotted bass exhibited good size structure, having a PSD of 39 and an  $RSD_{14}$  of 14 (Table 44). Table 12 compares the size structure values of black bass populations in Laurel River Lake to other SEFD lakes sampled in 2010.

#### Black Bass Sampling (Fall)

Nocturnal electrofishing was conducted in the Laurel River arm during September 2010 to index largemouth bass year class strength (Tables 45 and 46). CPUE of age-0 largemouth bass in 2010 was lower than catch rates in 2009. As a result of the low age-0 catch rate, the lake received a supplemental stocking

of 39,766 4.0-in fingerlings in October 2010 to bolster the low year class. Relative weight (Wr) values for largemouth and spotted bass collected during September sampling are shown in Table 47.

#### 2010 Daytime Creel Survey

A roving daytime creel survey was conducted on Laurel River Lake (6,060 acres) from March 8-October 31 2010. The lake was stratified into two survey areas (upper and lower) and the survey was run 16 days per month in March, April, September, and October. The sampling frequency was reduced to 12 days in May, and 7 days in June and July, and 9 days in August to incorporate a nighttime creel survey at the lake.

Results of the daytime creel survey are shown in Tables 48-54. Anglers took an estimated 10,817 fishing trips and expended an estimated 41,358 hours (6.8 man hours/acre) during the survey period. Black bass anglers accounted for 61% of all trips taken, followed by walleye anglers at 20%.

#### *2010 Nighttime Creel Survey*

An access point nighttime creel survey was conducted on Laurel River Lake (6,060 acres) from May 18-August 22 2010. The survey was conducted 2 nights in May (1 weekday night and 1 weekend night), and 8 nights per month in June and July (4 weekday nights and 4 weekend nights), and 6 nights in August (3 weekday nights and 3 weekend nights). The survey ran from 10:00 pm until 3:00 am at four access sites (probability in parentheses): Flatwoods (0.4), Holly Bay (0.2), Grove (0.2), and Marsh Branch (0.2). Fishing pressure counts were made by counting the number of fishing boat trailers in the parking lot at 10:00 pm and again at 3:00 am, and then the numbers were averaged. During the interview process, the number of anglers per boat was recorded and an average number of anglers per boat was calculated. The final pressure count was calculated by multiplying the average number of boats X average number of anglers per boat.

Results from the nighttime creel survey are shown in Tables 55-60. Anglers took an estimated 7,107 fishing trips and expended an estimated 30,581 hours (5.1 man hours/acre) during the survey period. Black bass anglers accounted for 52% of all trips taken, followed by walleye (38%) and catfish (8%) anglers.

#### *Angler Attitude Survey*

An angler attitude survey was conducted in conjunction with the creel survey to gather angler opinions about the various fisheries at Laurel River Lake (Figure 1). A total of 262 anglers were interviewed. Eighty-three percent of the largemouth bass anglers were satisfied with the largemouth bass fishery at the lake, with the number of fish being the only reason for their dissatisfaction. Ninety-three percent of the smallmouth bass anglers were satisfied with the smallmouth bass fishery at Laurel River Lake, with the number of fish and wanting the length limit to increase to 21.0-in were the reasons listed for their dissatisfaction. Sixty-four percent of the spotted bass anglers were satisfied with the spotted bass fishery, with the number and size of fish being the main reasons for angler dissatisfaction.

Over half of the crappie anglers were satisfied with the crappie fishery. Of the crappie anglers dissatisfied with the crappie fishery, the number of fish was the only reason for their dissatisfaction.

Over 90% of the trout anglers were satisfied with the trout fishery at Laurel River Lake.

Almost 90% of the walleye anglers were satisfied with the walleye fishery at Laurel River Lake. Of the walleye anglers that were dissatisfied with the walleye fishery, the number on fish was the only reason listed for their dissatisfaction.

One hundred percent of the bluegill anglers were satisfied with the bluegill fishery at Laurel River Lake.

Nineteen percent of the anglers at Laurel River Lake would support a reduction in the statewide crappie creel limit to 20 fish, and 81% of the anglers had no opinion on the crappie creel limit reduction. Over 90% of the anglers fish Laurel River Lake more than 10 times per year, and over 90% of the anglers are satisfied the current regulations at Laurel River Lake.

### **Cedar Creek Lake (784 acres; Lincoln Co.)**

#### Black Bass Sampling (Spring)

Nocturnal electrofishing was conducted on 10 May 2010 to assess the largemouth bass population in Cedar Creek Lake. The length-frequency and CPUE of largemouth bass is shown in Table 61. Size structure of largemouth bass was good (PSD=45, RSD<sub>15</sub>=22; Table 62). The catch-per-hour (by area and length group) of largemouth bass for 2003-2010 is shown in Table 63. All of the CPUE management objectives for the largemouth bass population were exceeded (Table 64).

Age-growth data from largemouth bass collected in 2010 is shown in Table 65. Age-2 largemouth bass comprised 47% of the largemouth bass catch (Table 66). The largemouth bass assessment score was 17 (rating=excellent; Table 67).

#### Black Bass Sampling (Fall)

Nocturnal electrofishing was conducted on 29 September 2010 to index the largemouth bass year-class strength (Tables 68 and 69). Catch rates of age-0 bass in 2010 had increased over catch rates observed in 2009 (Table 69). Relative weight (Wr) values for largemouth bass are found in Table 70.

#### Bluegill/Redear Sunfish Sampling

Daytime electrofishing was conducted on 14 June 2010, in conjunction with the Black Bass Research (BBR) section, to assess the bluegill and redbreast sunfish populations in Cedar Creek Lake. The length-frequency and CPUE of bluegill and redbreast sunfish is shown in Table 71. The catch-per-hour (by length group) of bluegill and redbreast sunfish is shown in Table 72. PSD and RSD values are shown in Table 73. Age-growth of bluegill is shown in Table 74. Six year classes were represented in the catch of bluegill, with 2008 and 2009 year classes comprising 95% of the catch (Table 75). The bluegill population assessment score was 5 (rating=poor; Table 76). Age-growth of redbreast sunfish is shown in Table 77. Seven year classes were represented in the catch of redbreast sunfish, with the 2008 and 2009 year classes comprising 70% of the catch (Table 78). The redbreast sunfish assessment score was 5 (rating=poor; Table 79).

### **Bert T. Combs Lake (36 acres; Clay Co.)**

#### Channel Catfish Sampling

Channel catfish sampling using tandem hoop nets was conducted at Bert T. Combs Lake in October 2010. Forty-two channel catfish were collected. The length-frequency of the channel catfish is shown in Table 80.

### **Beulah Lake (87 acres; Jackson Co.)**

#### Channel Catfish Sampling

Channel catfish sampling using tandem hoop nets was conducted at Beulah Lake in October 2010. Thirty-five channel catfish were collected. The length-frequency of the channel catfish is shown in Table 81.

### **Laurel Creek Lake (43 acres; McCreary Co.)**

#### Black Bass Sampling (Spring)

Nocturnal electrofishing was conducted on 14 April 2010 at Laurel Creek Lake to assess the black bass population. Length frequency and CPUE for largemouth bass are shown in Table 82. The catch-per-hour (by length group) for largemouth bass species is shown in Table 83. Table 84 lists the PSD and RSD values for largemouth bass in the lake.

## **Liberty Lake (81 acres; Casey Co.)**

### Black Bass Sampling (Spring)

Nocturnal electrofishing was conducted on 13 April 2010 at Liberty Lake to assess the black bass population. Length frequency and CPUE for largemouth and spotted bass are shown in Table 85. The catch-per-hour (by length group) for largemouth bass species is shown in Table 86. Table 87 lists the PSD and RSD values for largemouth bass in the lake. Age-growth data from largemouth bass collected in 2010 is shown in Table 88. Seven year classes were represented in the catch, with age-2 largemouth bass comprising 58% of the largemouth bass catch (Table 89). The largemouth bass assessment score was 12 (rating=good; Table 90).

### Bluegill/Redear Sunfish Sampling

Daytime electrofishing was conducted on 17 June 2010 to assess the bluegill and redear sunfish populations in Liberty Lake. No redear sunfish were collected during sampling. The length-frequency and CPUE of bluegill is shown in Table 91. The catch-per-hour (by length group) of bluegill is shown in Table 92. PSD and RSD values are shown in Table 93. Age-growth of bluegill is shown in Table 94. Four year classes were represented in the catch of bluegill, with the 2009 year class comprising 74% of the catch (Table 95). The bluegill population assessment score was 7 (rating=fair; Table 96).

### Crappie Sampling

Trap netting was conducted in late October 2010 to assess the crappie population in Liberty Lake. In 12 net-nights, only one (12.0 in) white crappie was collected.

## **Lake Linville (358 acres; Rockcastle Co.)**

### Black Bass Sampling (Spring)

Nocturnal electrofishing was conducted on 26 April 2010 at Lake Linville to assess the black bass population. Length frequency and CPUE for the black bass populations are shown in Tables 97-99. A population assessment for largemouth bass is shown in Table 100. Three of the four catch rate management objectives were met, with the CPUE of  $\geq 15.0$  in largemouth bass failing to meet the management objective. The size structure for the largemouth bass population is poor, with a PSD value of 20 ( $RSD_{15}=4$ ), and the spotted bass population is also comprised of small individuals ( $PSD=14$ ,  $RSD_{14}=0$ ; Table 101). Age-growth data from spotted bass collected in 2010 is shown in Table 102. Six year classes were represented in the catch, with spotted bass ages 2-4 comprising 92% of the spotted bass catch (Table 103). The spotted bass assessment score was 12 (rating=good; Table 104).

### Black Bass Sampling (Fall)

Nocturnal electrofishing was conducted on 30 September 2010 to index the largemouth bass year-class strength (Tables 105 and 106). Catch rates of age-0 largemouth bass in 2010 were lower than in 2009, but were near the historical averages (Table 106). Table 18 compares the CPUE of age 0 largemouth bass in Lake Linville to other SEFD lakes sampled in 2010. Relative weight values for largemouth bass and spotted bass are in Table 107.

### Hybrid Striped Bass and White Bass Sampling

Gill netting was conducted in late October to assess the hybrid striped bass and white bass population in Lake Linville. A total of 57 hybrid striped bass were collected in 10 net-nights for a catch rate of 5.70 fish/net-night, and a total of 64 white bass were collected for a catch rate of 6.40 fish/net-night. Length frequency and CPUE of hybrid striped bass and white bass is shown in Table 108. Age-growth for hybrid striped bass is shown in Table 109. Two year-classes were represented in the hybrid striped bass catch, with the 2010 year class (age-0; 74%) being most abundant (Table 110). The hybrid striped bass assessment score was 2 (rating=poor; Table 111). Relative weight ( $W_r$ ) values for hybrid striped bass are

shown in Table 112. Age-growth for white bass is shown in Table 113. Four year-classes were represented in the white bass catch, with the 2009 year class (age-1; 72%) being most abundant (Table 114). The white bass assessment score was 3 (rating=poor; Table 115). Relative weight (Wr) values for white bass are shown in Table 116.

#### ***2010 Daytime Creel Survey***

A daytime access point creel survey was conducted 16 days/month on Lake Linville (358 acres) from 11 March - 31 October 2010. Results are shown in Tables 117 through 124. Anglers made an estimated 15,876 fishing trips and expended 61,969 hours (173.1 man-hours/acre) during the survey period. Panfish anglers accounted for almost half (45%) of the fishing trips to the lake, followed by black bass (31%) and catfish (17%) anglers.

#### ***Angler Attitude Survey***

An angler attitude survey was conducted during the creel survey to gather opinions on the various fisheries in Lake Linville (Figure 2). A total of 199 anglers were interviewed. Thirty-six percent of black bass anglers were satisfied with the bass fishery at Lake Linville. Of the anglers who were dissatisfied, the size of the fish (83%) was the most important reason for their dissatisfaction.

Thirty-five percent of the crappie anglers were satisfied with the crappie fishery at Lake Linville. The number and size of the fish were the most cited reasons for the dissatisfaction with the crappie fishery.

Three-fourths of catfish anglers (74%) were satisfied with the catfish fishery at Lake Linville. The number of fish and size of fish were the most important reasons for angler dissatisfaction with the catfish fishery.

Most bluegill anglers (86%) were satisfied with the bluegill fishery at Lake Linville. Anglers listed the number of fish and the size of fish as the most important reasons for their dissatisfaction with the bluegill fishery.

Three-fourths of the hybrid striped bass anglers (77%) were satisfied with the hybrid striped bass fishery at Lake Linville. The number of fish and size of fish were the most important reasons for angler dissatisfaction with the hybrid striped bass fishery.

Approximately seventy percent of the anglers would support a reduction in the statewide crappie creel limit to 20 fish. Seventy-eight percent of the anglers fish Lake Linville more than 10 times per year. Nearly three-fourths of the anglers are satisfied with the current regulations at Lake Linville.

#### **Stanford Reservoir (38 acres; Lincoln Co.)**

##### **Black Bass Sampling (Spring)**

Nocturnal electrofishing was conducted on 14 April 2010 at Stanford Reservoir to assess the black bass population. Length frequency and CPUE for largemouth bass are shown in Table 125. The catch-per-hour (by length group) for largemouth bass species is shown in Table 126. Table 127 lists the PSD and RSD values for largemouth bass in the lake.

#### **Wood Creek Lake (625 acres; Laurel Co.)**

##### **Black Bass Sampling (Spring)**

Nocturnal electrofishing was conducted on 20 April 2010 in the Dam, Pump Station, and Dock areas of Wood Creek Lake to assess the black bass population. Length frequency and CPUE for black bass are shown in Table 128. The size structure for largemouth bass was good, having a PSD value of 52 (RSD<sub>15</sub>=15; Table 129). The spotted bass population had a poor size structure (PSD=20, RSD<sub>14</sub>=0; Table 129). Catch-per-hour (by length group) for largemouth and spotted bass are shown in Tables 130 and 131,

respectively. A largemouth bass population assessment is shown in Table 132. With the exception of the CPUE of  $\geq 15.0$  in largemouth bass, the remaining catch rate management objectives were met (Table 132). Age-growth data from largemouth bass collected in 2010 is shown in Table 133. Ten year classes were represented in the catch, with largemouth bass ages 2-3 comprising 58% of the largemouth bass catch (Table 134). The largemouth bass assessment score was 11 (rating=fair; Table 135).

#### Black Bass Sampling (Fall)

Nocturnal electrofishing was conducted on 23 September 2010 in the Dam, Pump Station, and Dock areas of Wood Creek Lake to index largemouth bass year class strength (Tables 136 and 137). Catch rates of age-0 largemouth bass in 2010 were higher than in previous years (Table 137). Table 18 compares the CPUE of age 0 largemouth bass in Wood Creek Lake to other SEFD lakes sampled in 2010. Relative weight values for largemouth and spotted bass are in Table 138.

Table 1. Summary of sampling conditions by waterbody, species sampled, and date for the Southeastern Fisheries District in 2010.

| Water body             | Location            | Species             | Date        | Time (24hr) | Gear      | Weather                     | Water temp. F | Water level           | Secchi (in) | Conditions | Pertinent sampling comments                                                                                                |      |                    |
|------------------------|---------------------|---------------------|-------------|-------------|-----------|-----------------------------|---------------|-----------------------|-------------|------------|----------------------------------------------------------------------------------------------------------------------------|------|--------------------|
| Lake Cumberland        | Dam                 | Black bass          | 4/19/2010   | 1945        | shock     | slightly overcast, 70s      | 62            | 681                   | 45          | good       | all 2010 samples for all species conducted under reduced water levels due to dam repairs, which altered sampling locations |      |                    |

Figure 1. Results of the Laurel River Lake angler attitude survey conducted from March 8-October 31, 2010.

**LAUREL RIVER LAKE ANGLER ATTITUDE SURVEY 2010**

1. Have you been surveyed this year? Yes - stop survey                      No – continue
2. Name \_\_\_\_\_ and Phone number \_\_\_\_\_ (Optional)
3. Which species of fish do you fish for at Laurel River Lake (check all that apply)? (N=262)  
91% Bass      12% Crappie      5% Trout      24% Walleye      5% Bluegill      1% Catfish
4. Which one species do you fish for most at Laurel River Lake (check only one)? (N=254)  
84% Bass      2% Crappie      2% Trout      10% Walleye      2% Bluegill      <1% Catfish

-Answer the following questions for each species you fish for -- (see question 3)

**Largemouth Bass Anglers**

5. In general, what level of satisfaction do you have with largemouth bass fishing at Laurel River Lake? (N=178)  
30% Very satisfied      53% Somewhat satisfied      1% Neutral      15% Somewhat dissatisfied      1% Very dissatisfied
- 5a. If you responded with somewhat or very dissatisfied in question (5) -- what is the single most important reason for your dissatisfaction? (N=27)  
100% Number of fish      0% Size of fish      0% Not happy with regulations      0% Too many boaters

**Smallmouth Bass Anglers**

6. In general, what level of satisfaction do you have with smallmouth bass fishing at Laurel River Lake? (N=166)  
37% Very satisfied      56% Somewhat satisfied      1% Neutral      5% Somewhat dissatisfied      1% Very dissatisfied
- 6a. If you responded with somewhat or very dissatisfied in question (6) -- what is the single most important reason for your dissatisfaction? (N=8)  
88% Number of fish      0% Size of fish      0% Not happy with regulations      0% Too many boaters      12% Increase size limit to 21 in

**Spotted Bass Anglers**

7. In general, what level of satisfaction do you have with spotted bass fishing at Laurel River Lake? (N=165)  
14% Very satisfied      50% Somewhat satisfied      4% Neutral      25% Somewhat dissatisfied      7% Very dissatisfied      1% No opinion
- 7a. If you responded with somewhat or very dissatisfied in question (7) -- what is the single most important reason for your dissatisfaction? (N=47)  
98% Number of fish      2% Size of fish      0% Not happy with regulations      0% Too many boaters

**Crappie Anglers**

8. In general, what level of satisfaction do you have with crappie fishing at Laurel River Lake? (N=29)  
7% Very satisfied      45% Somewhat satisfied      35% Neutral      3% Somewhat dissatisfied      7% Very dissatisfied      3% No opinion
- 8a. If you responded with somewhat or very dissatisfied in question (8) -- what is the single most important reason for your dissatisfaction? (N=3)  
100% Number of fish      0% Size of fish      0% Not happy with regulations      0% Too many boaters

**Trout Anglers**

9. In general, what level of satisfaction do you have with the trout fishing at Laurel River Lake? (N=12)  
67% Very satisfied      25% Somewhat satisfied      8% Neutral      0% Somewhat dissatisfied      0% Very dissatisfied
- 9a. If you responded with somewhat or very dissatisfied in question (9) -- what is the single most important reason for your dissatisfaction? (N=0)  
0% Number of fish      0% Size of fish      0% Not happy with regulations      0% Too many boaters

<continued on back>

**Walleye Anglers**

1. In general, what level of satisfaction do you have with the walleye fishing at Laurel River Lake? (N=57)  
42% Very satisfied    46% Somewhat satisfied    7% Neutral    5% Somewhat dissatisfied    0% Very dissatisfied
- 10a. If you responded with somewhat or very dissatisfied in question (10) – what is the single most important reason for your dissatisfaction? (N=3)  
100% Number of fish    0% Size of fish    0% Not happy with regulations    0% Too many boaters

**Bluegill Anglers**

2. In general, what level of satisfaction do you have with the bluegill fishing at Laurel River Lake? (N=13)  
77% Very satisfied    23% Somewhat satisfied    0% Neutral    0% Somewhat dissatisfied    0% Very dissatisfied
- 11a. If you responded with somewhat or very dissatisfied in question (11) – what is the single most important reason for your dissatisfaction? (N=0)  
0% Number of fish    0% Size of fish    0% Not happy with regulations    0% Too many boaters

**All Anglers**

3. Would you support or oppose a reduction in the current statewide 30 fish daily crappie creel limit to 20 fish? (N=250)  
19% Support    <1% Oppose    81% No opinion
4. How many times do you fish Laurel River Lake a year? (N=254)  
0% First time    2% 1 to 4    8% 5 to 10    93% More than 10
5. Are you satisfied with the current size and creel limits on all sport fish at Laurel River Lake? (N=254)    94% Yes    6% No
- If **NO**:
- 14a. If not, which species are you dissatisfied with and what size and creel limits would you prefer?

Largemouth bass size limit (N=3)  
100% 18 in

Largemouth bass creel limit (N=3)  
67% 2  
33% 5

Smallmouth bass size limit (N=4)  
25% 16-21 in  
25% 16 in  
50% 21 in

Smallmouth bass creel limit (N=4)  
75% 2  
25% 5

Spotted bass size limit (N=9)  
78% 12 in  
22% 15 in

Spotted bass creel limit (N=9)  
100% 5

**LAKE LINVILLE ANGLER ATTITUDE SURVEY 2010**

1. Have you been surveyed this year? Yes - stop survey                      No – continue
2. Name \_\_\_\_\_ and Phone number \_\_\_\_\_ (Optional)
3. Which species of fish do you fish for at Lake Linville (check all that apply)? (N=199)  
58% Black bass      43% Crappie      61% Channel catfish      72% Bluegill      12% Hybrid striped bass      1% Carp
4. Which one species do you fish for most at Lake Linville (check only one)? (N=197)  
38% Black bass      6% Crappie      25% Channel catfish      32% Bluegill      1% Hybrid striped bass  
 -Answer the following questions for each species you fish for – (see question 3)

**Black Bass Anglers**

5. In general, what level of satisfaction do you have with black bass fishing at Lake Linville? (N=114)  
4% Very satisfied      32% Somewhat satisfied      20% Neutral      33% Somewhat dissatisfied      11% Very dissatisfied
- 5a. If you responded with somewhat or very dissatisfied in question (5) – what is the single most important reason for your dissatisfaction? (N=48)  
15% Number of fish      83% Size of fish      0% Not happy with regulations      2% Lake conditions

**Crappie Anglers**

6. In general, what level of satisfaction do you have with crappie fishing at Lake Linville? (N=85)  
9% Very satisfied      26% Somewhat satisfied      4% Neutral      33% Somewhat dissatisfied      26% Very dissatisfied      2% No opinion
- 6a. If you responded with somewhat or very dissatisfied in question (6) – what is the single most important reason for your dissatisfaction? (N=47)  
64% Number of fish      34% Size of fish      0% Not happy with regulations      2% Lake conditions

**Channel Catfish Anglers**

7. In general, what level of satisfaction do you have with the channel catfish fishing at Lake Linville? (N=119)  
31% Very satisfied      43% Somewhat satisfied      13% Neutral      10% Somewhat dissatisfied      3% Very dissatisfied
- 7a. If you responded with somewhat or very dissatisfied in question (7) – what is the single most important reason for your dissatisfaction? (N=15)  
60% Number of fish      27% Size of fish      0% Not happy with regulations      7% Lake conditions      7% Creel and size increase

**Bluegill Anglers**

8. In general, what level of satisfaction do you have with the bluegill fishing at Lake Linville? (N=141)  
57% Very satisfied      29% Somewhat satisfied      1% Neutral      11% Somewhat dissatisfied      2% Very dissatisfied      1% No opinion
- 8a. If you responded with somewhat or very dissatisfied in question (8) – what is the single most important reason for your dissatisfaction? (N=17)  
41% Number of fish      53% Size of fish      0% Not happy with regulations      0% Lake conditions      6% Creel amount set

**Hybrid Striped Bass Anglers**

9. In general, what level of satisfaction do you have with the hybrid striped bass fishing at Lake Linville? (N=22)  
41% Very satisfied      36% Somewhat satisfied      5% Neutral      14% Somewhat dissatisfied      5% Very dissatisfied
- 9a. If you responded with somewhat or very dissatisfied in question (9) – what is the single most important reason for your dissatisfaction? (N=4)  
50% Number of fish      25% Size of fish      0% Not happy with regulations      0% Lake conditions      25% Size limit

<continued on back>

**All Anglers**

1. Would you support or oppose a reduction in the current statewide 30 fish daily crappie creel limit to 20 fish? (N=199)  
69% Support    27% Oppose    5% No opinion
2. How many times do you fish Lake Linville a year? (N=199)  
0% First time    9% 1 to 4    13% 5 to 10    78% More than 10
3. Are you satisfied with the current size and creel limits on all sport fish at Lake Linville? (N=198)    73% Yes    27% No

If NO:

12a. If not, which species are you dissatisfied with and what size and creel limits would you prefer?

## EASTERN FISHERY DISTRICT

### Project 1: Lake and Tailwater Fishery Surveys

#### FINDINGS

Table 1 shows sampling conditions by water body for eastern fishery district lakes in 2010.

#### **Buckhorn Lake**

Length frequency, catch-per-unit-effort (CPUE), and population assessment based on early spring sampling for muskellunge in 2010 using daytime electrofishing at Buckhorn Lake (1,230 acres) are shown in Tables 2 and 3. Musky were sampled through 46.1 in during electrofishing (Table 2). An assessment rating of "Good" was observed during 2010, down from "Excellent" in 2009 (Table 3). The 2010 sampling was presumably hindered somewhat by an approaching storm front. The  $\log_{10}$  length-weight equation for muskellunge during 2010 sampling was  $-4.42 + 3.55(\log_{10} \text{ length})$ . On 1 March 2010 the musky size limit in the lake changed from 40.0 in to 36.0 in. This may decrease CPUE of larger fish in the future. In 2009, a potential state record muskellunge was observed while sampling, but not caught. The fish was estimated to be 56.0-57.0 in. A total of 430 muskellunge (12.7 in) were stocked during September 2010. Muskellunge stocked in 2010 received a left pectoral fin clip for future identification. The tailwater below Buckhorn Lake continues to provide an additional good muskellunge fishery. During 2011, muskellunge will be sampled in the spring.

The black bass populations were sampled during the spring and fall (Tables 4-10). Largemouth bass comprise the major black bass species in this lake. The assessment rating has ranged from "Fair" to "Good" from 2003-2010 (Table 8). Due to low numbers of age-0 to age-1 fish, largemouth bass (4.0 in) have been supplementally stocked during October of 2005, 2006, 2008, and 2009 (Table 10). However, due to a strong 2010 year class, largemouth bass were not stocked in 2010. Additionally during 2010, the lake remained at summer pool for approximately 40 days longer than normal before being dropped to winter pool. This will aid in growth of age-0 bass and reduce their natural mortality to predation. Fish stocked in 2005 received a right pectoral fin clip, 2006 a left pectoral fin clip, 2008 a right pelvic fin clip, and 2009 a right pectoral fin clip for future identification.

White crappie were sampled using trap nets in November 2010 (Tables 11-15). An assessment value of "Good" was observed (Table 15). While the growth rate (based on length of age-2 fish at capture) appears to have increased slightly since the 2007 and 2008 samples, it is still slower than that of 2003 – 2005 (Table 15). At present there is an over abundance of small fish slowing growth. A length limit of 9.0 in was implemented on 1 March 2007 and since this time the growth rate has decreased. This will prevent fishing mortality from reducing smaller fish numbers at present. Future management may require this regulation to be removed to improve growth rates and reduce small fish numbers. However, there is the possibility of increased natural mortality or poor recruitment years to reduce fish numbers. Also, growth of younger fish can be increased by maintaining the summer pool for longer periods before drawdown to winter pool.

Habitat improvement work (Christmas tree reefs, hardwood brush piles, wood pallet structures, and vegetation) will continue to aid recruitment of age-0 largemouth bass and other fish in the lake. During 2011, black bass will be sampled in the spring and fall with boat electrofishing.

Additional fish stocking occurred throughout the year at the tailwater area below the dam. A total of 3,200 rainbow trout (8.0-12.0 in) were stocked during the months of April-June and October.

#### **Carr Creek Lake**

The black bass population was sampled during the spring and fall at Carr Creek Lake (710 acres). Tables 16-22 provide data from the spring and fall sampling. The assessment rating remained "Fair" for largemouth bass in 2010, which it has been 7 of the last 9 years. However, the total assessment value has been "9" for three of the past 4 years which is down from values of "11-12" normally seen at Carr Creek Lake. The spring CPUE (fish/hr) was the

lowest it has been in the past nine years. This may be due partially to a late sample and warm temperatures, however, there has been a somewhat steady decline in CPUE over the past 6 years. The reduced densities of largemouth bass are in large part due to poor recruitment of age-0 to age-1 fish. Fall electrofishing for black bass was conducted early during high water temperature and very few fish could be collected. This was similar to conditions in 2008 and 2009. Approximately 11,136 largemouth bass (4.0 – 5.0 in) were stocked in October. During the fall of each year from 2005-2010, largemouth bass were stocked to supplement low recruitment of age-0 to age-1 fish. Fish stocked in 2005 received a right pectoral fin clip, 2006 a left pectoral fin clip, 2007 a left pelvic fin clip, 2008 a right pelvic fin clip, 2009 a right pectoral fin clip, and 2010 a left pectoral fin clip for future identification. Further work will continue investigation of the recruitment of young fish. During 2011, fertilization will continue with 9-18-9 liquid fertilizer to aid recruitment success of young-of-the-year fish. Additionally, hydrilla will be monitored and control measures applied. Work will continue in cooperation with the local USACE office on habitat improvement projects including brush piles, Christmas tree reefs, native aquatic plant restoration and cypress tree plantings, hinge cut trees, and wood pallet structures.

Daytime electrofishing was completed on 15-16 March 2010 for walleye. Tables 23-26 list length frequency, CPUE, age frequency, relative weights, and population assessment for walleye. The CPUE of walleye in 2010 (12.74 fish/hr) was less than that of 2009 (21.34 fish/hr) yet comparable to that of 2008 (12.76 fish/hr; Table 23). CPUE was considerably higher from 2003 to 2007 (26.70-32.92 fish/hr). The reason for the decreased CPUE in recent years is that effort has increased substantially in order to collect enough broodstock. As sampling time has increased, CPUE has decreased, mainly due to sampling parts of the lake multiple times and areas that are less productive as sampling time increases. The fishery and growth rate remains very good. The assessment value in 2010 was “Good” (Table 26) and relative weights are excellent (Table 25). In 2004 there was a fish kill of walleye at Carr Creek of 100+ large adults, in 2005 a fish kill of large adult alewife, and in 2008 a fish kill of large gizzard shad. None of these fish kills have seemed to significantly impact the fishery. Mean relative weights are near or exceed 100 for all size groups of walleye examined (Table 25). The  $\log_{10}$  length-weight equation for walleye during 2010 was  $-3.59 + 3.14(\log_{10} \text{ length})$ . During 2010, walleye will be sampled in the spring (March). An estimated 36,033 walleye (1.61-1.67 in) were stocked in May 2010.

Data for black and white crappie sampled during the spring walleye electrofishing is presented in Tables 27-30. Due to very poor fall trap netting catches, spring electrofishing was initiated in 2007. This will continue to be used to monitor the population. The  $\log_{10}$  length-weight equation for black crappie was  $-3.61 + 3.30(\log_{10} \text{ length})$  and for white crappie was  $-3.99 + 3.67(\log_{10} \text{ length})$ . Approximately 7,100 black crappie and blacknose black crappie (3.0 in) were stocked in November 2007. Some of these blacknose crappie were observed in angler catches in 2009 and were legal size fish. The fishery has a special regulation of a 9.0-in minimum size. During the fall of 2009 a research study was initiated on white crappie recruitment. A total of 5,440 white crappie were stocked in 2009 and 9,676 white crappie were stocked in 2010. White crappie will be stocked for a minimum of 3 years during this study. Legal size fish at present are approximately 67% white crappie and 33% black crappie.

### Cranks Creek

Spring and fall electrofishing was completed at Cranks Creek Lake (219 acres) for black bass in 2010. Tables 31-37 provide data from spring and fall sampling. Largemouth bass continued to receive an assessment rating of “Good” (Table 35). Spring electrofishing CPUE for largemouth bass <8.0 in,  $\geq 15.0$  in, and  $\geq 20.0$  in were all at their highest point of the last 10 years (Table 32). The CPUE of age-0 largemouth bass collected in the fall of 2010 was higher than other years on record indicating a strong 2010 year class (Table 37). However, mean length of age-0 largemouth bass (4.3 in) remained low. This lake is very low in fertility and has had periodic problems with low pH. During 2011, black bass will be sampled in the spring and fall. Channel catfish will also be sampled in fall 2011 using baited-tandem hoop nets.

Additional concerns at this lake are possible aquatic vegetation control and random stockings of various sport fish by local residents. Due to the very clear water, aquatic plants can be very thick and thorough in coverage. Monitoring of aquatic vegetation will continue and herbicide will be applied to selected areas of thick stands of brittle naiad. Fisheries and law enforcement staff will continue to offer guidance to the public on fish stockings and the possible management implications.

## Dewey Lake

Black bass were sampled at Dewey Lake (1,100 acres) in the spring and fall of 2010 (Tables 38-44). The largemouth bass assessment rating was "poor" for the first time since 2003 (Table 42). This was due to poor timing of the spring sample which resulted in low CPUE. Recruitment of young-of-year fish remains consistent and has prevented the need for supplemental stocking of largemouth bass (Table 44).

White bass were sampled during March by electrofishing and in November by gill netting. This was in coordination with the Lake Fisheries Research (LFR) project. A summary of the data collected can be found in the LFR annual report. The last stocking of white bass (1.5 in) during this study was in 2007. 2010 was the final year for this research project and no white bass sampling is scheduled for 2011.

White and black crappie were sampled using trap nets in November 2010 (Tables 45-52). This sampling was cut short in time due to a mandatory furlough work day. An assessment value of "Good" was observed for white crappie (Table 51). While the overall white crappie CPUE (fish/net-night) was down, the growth rate has increased with the absence of hydrilla. Younger fish, especially, are showing much better growth rates than older fish that were spawned in years when hydrilla was still present.

A daytime creel survey was conducted at Dewey Lake from 1 April-24 October 2010 (Tables 53-60). The creel survey was a random roving creel design (date and time) and the lake was treated as one area. Surveys consisted of 2.0-6.0 hour periods (morning starting at 600 hrs and afternoon starting at 1300 hrs). Angler counts were conducted in the middle of each respective 6.0 hour time period.

The number of fishing trips during the 2010 creel survey was comparable to the previous creel survey in 2007 while the total angler hours were more in 2010 than in 2007 (Table 53). The total fishing trips and angler hours were 3,862 and 26,491, respectively in 2010 and 3,827 and 17,907 in 2007. Angler success rates during 2010 were 2.16% for black bass, 46.53% for crappie, 50.88% for panfish, and 20.51% for catfish (Table 54). Angler success rates during 2007 were 2.53% for black bass, 37.21% for crappie, 63.64% for panfish, and 26.47% for catfish. White crappie were the most numerous fish caught during the 2010 survey at 14,086 fish (Table 54). Largemouth bass were the second most numerous fish caught in 2010 at 10,450 fish (Table 54).

An angler attitude survey was conducted at the lake to obtain further information. Anglers were asked to answer a series of questions regarding the fishery at Dewey Lake (Appendix A). Anglers were surveyed throughout the creel during 2010 with anglers only being asked the questions once. A total of 210 surveys were completed during the lake creel. Black bass at 69.0% (N=145) were the most popular species fished for on the lake followed by crappie at 36.2% (N=76), channel catfish at 7.1% (N=15), bluegill at 6.7% (N=14), white bass at 5.7% (N=12), flathead catfish at 5.2% (N=11), blue catfish at 3.8% (N=8), and carp at 0.5% (N=1). Level of fishing satisfaction was asked for several fish groups or species and all categories exceeded 50.0% being somewhat satisfied to very satisfied except three. Angler fishing satisfaction of somewhat satisfied to very satisfied of  $\geq 50.0\%$  was observed for channel catfish at 86.7%, black bass at 74.3%, and crappie at 67.6%. Neutral was 54.5% for flathead catfish. Somewhat dissatisfied to very dissatisfied was 62.5% for blue catfish, and 57.1% for white bass.

Several stockings of various fish occurred during 2010. A total of 36,100 redear sunfish (1.0-1.5 in), and 17,610 blue catfish (5.0-7.0 in) were stocked. These stockings were in conjunction with zebra mussel and hydrilla management at the lake. Channel catfish fingerlings (32,532 fish; 3.0-7.0 in) were also stocked in Dewey Lake in 2010. Rainbow trout were stocked in the tailwater of Dewey Lake in April and May (1000 fish/month), and October (800 fish).

## Fishpond

Largemouth bass were sampled at Fishpond Lake (32 acres) on 22 April 2010 (Table 61). Due to the water clarity of this lake, nocturnal electrofishing was utilized. CPUE of largemouth bass in 2010 was down for every length group from 2009 and total CPUE (78.86 fish/hr) was at the lowest point since 1997 (Table 62). The low CPUE is not cause for alarm as it is likely due to a large amount of filamentous algae extending 10-12 ft from the shoreline and other conditions limiting sampling. While CPUEs were down from recent years, the CPUE of largemouth bass

$\geq 20.0$  in (4.57 fish/hr) was still above average for lakes in the Eastern District. The PSD value decreased from 2009 (66) to 2010 (54), while the RSD value increased slightly from 2009 (17) to 2010 (18; Table 63). Additional management at Fishpond Lake entails fertilization of the lake during the spring for increasing zooplankton density for young-of-year fishes. Fertilization will be actively pursued in 2011 to limit the filamentous algae growth. A total of 5,000 rainbow trout (8.0 in) are stocked annually during January, April, May, and October. Channel catfish (9.0 in) are stocked every other year. Largemouth bass will again be sampled in 2011.

### **Fishtrap Lake**

Spring and fall 2010 black bass sampling data for Fishtrap Lake (1,143 acres) is shown in Tables 64-73. Largemouth, smallmouth, and spotted bass all provide significant fisheries at this lake. The population assessment ratings for largemouth bass and smallmouth bass remain "Good" (Tables 70-71). Below average recruitment of age-0 largemouth bass (Table 73) was supplemented with 11,454 largemouth bass (4.4 in) in October. These stocked fish received a left pectoral fin clip for future identification. Often, there are high water events with flood control management that can act to lower recruitment at this lake. Sampling during 2011 will occur in the spring and fall for black bass. Approximately 30,000 smallmouth bass fry were stocked in the lake in 2010.

Fall 2010 white crappie trap net sampling data for Fishtrap Lake is shown in Tables (74-78). The assessment rating was "Good" (Table 78). The mean total length of age 2+ fish at 7.5 in is down from previous years. This will be monitored following the implementation of a 9.0 in minimum size limit on crappie in 2010 as to whether fish continue to decrease in growth and become stunted.

About 23,002 hybrid striped bass (2.1 in) were stocked in the lake during the month of June. A total of 36,100 redear sunfish were stocked for utilizing the introduced zebra mussels for food. Native walleye fry (60,000) were stocked in April in the lake and 33,014 advanced fingerlings (1.2 in) were stocked in Levisa Fork upstream of Fishtrap Lake as part of a research study which began in 2010. Stockings and data collection pertaining to this study will be coordinated through the Lake Fisheries Research section. Rainbow trout (6,600 fish total) were stocked in the tailwater in April, May, June, October, and November.

### **Martin County Lake**

Largemouth bass were sampled with electrofishing gear on 8 April 2010. Tables 79-80 contain length frequency, CPUE, PSD, and RSD data. Size distribution of largemouth bass in this small 3-acre lake is good for supporting a panfish fishery. The PSD level continues to remain below 40 with numerous smaller bass. Additionally during 2010, Martin County Lake was sampled by the "FINS" staff with boat electrofishing gear. This sample effort looked at sunfish, catfish, and black bass. In the future Martin County Lake will be monitored or sampled each year by just the FINS program staff.

### **Martin County Reservoir**

This lake has recovered slowly since the Martin County coal slurry spill of October 2000. Current fish stockings occur with a total of 4,500 rainbow trout stocked annually during April, May, and October and channel catfish on an every other year rotation. Spring daytime electrofishing was conducted at this lake for largemouth bass on 11 May 2010. Length frequency and CPUE is presented in Table 81. The largemouth bass population appears to be stunted, with high numbers of fish  $< 13.0$  in and only 2 fish  $> 15.0$  in. A PSD value of 20 for largemouth bass in 2010 (Table 82) and a PSD value of 64 for bluegill in 2009 further reflect a population with high numbers of stunted largemouth, effectively cropping bluegill leading to better bluegill growth. Martin County Lake will not be sampled in 2011.

## **Martins Fork Lake**

Martins Fork Lake (330 acres) was sampled for black bass in the spring and fall (Tables 83-89) and walleye in the spring. Assessment scores for largemouth bass have remained "Fair" from 2003 – 2010 (Table 87). While densities are low for largemouth bass, their length groups are rather evenly distributed (Table 84), and they show exceptional growth rates. The smaller coosa bass (redestye bass) continue to maintain a viable population in the lake. However, the black bass fishery is dominated in numbers by largemouth bass and spotted bass (Table 83).

Walleye numbers continue to decrease greatly with the elimination of their annual stocking in 2005. No walleye were found in 2010, and 2009 sampling found only 17 individuals, all age-5 or older (Table 90). Once the Erie strain walleye have been eliminated from Martins Fork Lake, native Rockcastle strain walleye will be stocked. Largemouth bass will be sampled again in the spring and fall of 2011 and walleye will be sampled again in the spring of 2011 if conditions allow.

Channel catfish are scheduled to be stocked in 2011. Brush piles will be put in the lake during summer 2011 in an attempt to boost the crappie population. An additional fishery furnished by Martins Fork Lake that continues to be popular with anglers is the tailwater rainbow trout fishery. 4,200 trout were stocked in the tailwater from April-October 2010. Occasionally walleye are also caught in this area as well.

## **Paintsville Lake**

During 2010, black bass were sampled in both the spring and fall (Tables 91-97). In 2002, a 12.0-15.0 in protective slot length limit was implemented on largemouth and smallmouth bass. Anglers haven't made an impact in the numbers of 8.0-12.0 in largemouth bass, however, finally in 2010 increases in numbers of largemouth bass greater than 15.0 in were improving (Table 92). This improved the assessment rating of the largemouth bass fishery from "Poor" in 2009 to "Good" in 2010 (Table 95). During 2006, smallmouth bass were removed from the 12.0-15.0 in protective slot length limit and placed under an 18.0 in minimum length limit. Also, water quality parameters have prevented smallmouth bass from ever developing a good fishery in the 1,150 acre lake. During 2006, water withdrawals from the lake were altered to avoid pulling water from the preferred smallmouth bass, trout, and walleye cool water habitat. A total of 20,318 smallmouth bass (mean length=2.3 in) were stocked in June 2010 to supplement low numbers of smallmouth bass in hopes of establishing a smallmouth bass fishery. Smallmouth bass will be stocked annually through 2014.

Quality of summertime cool water habitat has improved since 2006 and is expected to continue in future years. Also, this will aid in regenerating the good trout and walleye fisheries once present from the late 1980's to early 1990's. The lake received a stocking of approximately 18,500 rainbow trout (8.0 in) in January. Walleye (n=58,015, mean length=1.6 in) were also stocked in May 2010. Additional fisheries provided by the lake are the brown and rainbow trout fisheries found in the tailwater area below the dam. Approximately 16,600 rainbow trout were stocked in the tailwater from April to November, and 300 brown trout were stocked in the tailwater in April 2010.

Walleye and white crappie were sampled during March using daytime electrofishing. Walleye data is presented in Tables 98-100. The walleye assessment rating continues to be "Fair"; however, its score has improved slightly (Table 100). Future evaluations will hopefully show ratings of "Good." White crappie data is presented in Tables 101-104. White crappie CPUE in 2009 (39.02 fish/hr) and 2010 (22.62 fish/hr) is up from that of 2008 (8.09 fish/hr; Table 102). Best numbers occur in the upper lake above the junction of Little Paint and Open Fork branches. Black crappie are present, but rare in angler catches and electrofishing samples.

Hydrilla was treated at the Lost Creek boat ramp to aid in access. During summer 2010, approximately 20 spawning benches were placed in the lake for smallmouth bass and/or other black bass nesting habitat. Black bass, white crappie, and walleye will be sampled via electrofishing during the spring and black bass will be sampled again in the fall 2011. Spring black bass sampling will continue to incorporate three electrofishing crews in order to get a better sample of the lake and avoid problems such as those experienced with one of only two crews having a break down in 2009. A creel and angler attitude survey will take place on Paintsville Lake in 2011 in order to evaluate angler exploitation of and attitudes towards the fisheries in the lake.

### **Pan Bowl Lake**

Length frequency and CPUE were collected for largemouth bass on 13 April 2010 (Table 105). Additional summary of data can be found in Tables 106-109. The slow growth rate and sometimes cyclic high recruitment of young-of-the-year fish make this fishery difficult to manage for continuous angler satisfaction. The PSD level of 14 (Table 107) is very low, which would be good for a quality panfish fishery. However, this lake has always been known for its trophy bass and is a popular lake for tournaments. Some limited chemical application was done in 2010 to lessen areas of heavy plant growth. Also during 2010, approximately 20 grass carp were stocked in the lake for vegetation reduction. With reduced plant density it is believed this will allow largemouth bass to increase predation on sunfish. CPUEs for all length groups of largemouth bass except those <8.0 in were somewhat lower than previous years (Table 106). The increase of small fish each year is likely due to the high abundance of Eurasian milfoil in Pan Bowl Lake since 2007.

Management at this 98 acre lake also includes an every other year stocking of channel catfish (9.0 in) and spring electrofishing for bluegill and redear sunfish. Sampling for 2011 will look at largemouth bass again.

### **Pikeville City Lake**

Pikeville City Lake (20 acres) has primary fisheries of largemouth bass, bluegill, crappie, carp, and catfish. This lake has high fertility, which is not common in most lakes of the Eastern District. During the summer, oxygen is added to the lake by 1 to 4 aerators as needed to prevent fish kills. The largemouth bass fishery has been very good for big fish for many years. On 1 March 2006, a regulation of catch-and-release-only for largemouth bass went into effect. During 2008, Pikeville stocked crappie and hybrid striped bass. An increase in crappie numbers was not noted during 2008 spring electrofishing and no hybrid striped bass were observed. Additional crappie were stocked in 2009. Electrofishing was conducted on 21 April 2010 for largemouth bass. Tables 110-112 contain information from the April daytime electrofishing sample for bass. Total CPUE of largemouth bass increased from 2009 to 2010 in all length groups except largemouth bass >20.0 in which was the same in 2009 and 2010 (8.00 fish/hr; Table 111). The CPUEs of fish  $\geq 15.0$  in (52.57 fish/hr) and  $\geq 20.0$  in (8.00 fish/hr) in Pikeville City Lake are the highest in the Eastern Fisheries District. PSD and RSD have both increased from 2008 (56 and 46 respectively) to 2009 (65 and 48 respectively) to 2010 (77 and 55 respectively; Table 112). The increased PSD and RSD and the continued high CPUE of fish  $\geq 20.0$  in are indicative of a big bass fishery; a sign that the catch-and-release-only regulation is working for the time being. During 2011, no sampling will be conducted on Pikeville City Lake.

### **Yatesville Lake**

Black bass (largemouth and spotted bass) were sampled during the spring and fall of 2010 (Tables 112-119). The largemouth bass population at Yatesville Lake (2,280 acres) receives a great amount of fishing pressure (resident and nonresident) through tournaments on the weekends. Largemouth bass had an assessment value of 13 ("Good") in 2010 (Table 117), which is slightly greater than the value of 12 in 2008 and 2009. Monitoring will continue each year to determine if supplemental age-0 largemouth bass stocking will be necessary.

Several fish stockings occurred in 2010. A total of 36,100 redear sunfish were stocked in the lake during September. Rainbow trout were stocked in the tailwater of Yatesville Lake in April, May, and November (600 fish/month, 1,800 fish total).

During 2011, fish sampling and habitat work will continue at Yatesville Lake. Black bass will be sampled in the spring and fall and white crappie in the fall. Habitat work will primarily consist of selective cutting of cedar trees from the Yatesville Lake WMA property to create brush piles. This habitat should improve the recruitment for largemouth bass and white crappie.

Table 1: Summary of 2010 sampling conditions by waterbody, species sampled and date.

| Water body        | Species  | Date  | Time (24hr) | Gear     | Weather                | Water Temp (°F) | Water level (elev ft) | Secchl (in) | Pertinent sampling comments <sup>a,b</sup>                                                           |

## Appendix A. Dewey Lake Angler Attitude Survey Results

Frequency Table (N=210)

3. Which species do you fish for at Dewey Lake?

|                  | Frequency | Percent |
|------------------|-----------|---------|
| Bass             | 145       | 69.0%   |
| Crappie          | 76        | 36.2%   |
| Channel Catfish  | 15        | 7.1%    |
| Bluegill         | 14        | 6.7%    |
| White Bass       | 12        | 5.7%    |
| Flathead Catfish | 11        | 5.2%    |
| Blue Catfish     | 8         | 3.8%    |
| Carp             | 1         | 0.5%    |

4. Which one species do you fish for most at Dewey Lake?

|                  | Frequency | Percent |
|------------------|-----------|---------|
| Bass             | 124       | 67.0%   |
| Crappie          | 47        | 25.4%   |
| Channel Catfish  | 3         | 1.6%    |
| Flathead Catfish | 1         | 0.5%    |
| White Bass       | 4         | 2.2%    |
| Bluegill         | 5         | 2.7%    |
| Carp             | 1         | 0.5%    |
| Total            | 185       |         |
| No Response      | 25        |         |

5. What level of satisfaction do you have with bass fishing at Dewey Lake?

|                       | Frequency | Percent |
|-----------------------|-----------|---------|
| Very Satisfied        | 34        | 23.6%   |
| Somewhat Satisfied    | 73        | 50.7%   |
