# WESTERN FISHERY DISTRICT 

## Project A: Lake and Tailwater Fishery Surveys

FINDINGS

Sampling conditions for each survey event are listed in Table 1.

## Kentucky Lake

During the spring, 651 black bass were collected by diurnal electrofishing (120 PPS, DC current). During this sampling period, 632 largemouth bass ( 63.2 fish/hr) were collected from Blood River, Jonathan Creek, Big Bear, and Sugar Bay (Table 2). The catch rates (CPUE) for largemouth bass between embayments varied ( 40.8 to 129.6 fish $/ \mathrm{hr}$ ). This variation could be due to changing weather conditions during the sampling period. The main similarity between embayments was that each one yielded a high catch rate of largemouth bass between 12.0 and 16.0 in. A secondary similarity was the moderate catch rate of small ( $<8.0 \mathrm{in}$ ) largemouth bass, with the exception of Blood River where it was low.

The spring bass data was used to complete the lake specific assessment (Table 3). The lake specific assessment suggests that the largemouth bass population rated "fair". The growth rate parameter was determined with age data collected in the fall, but back-calculated to spring growth. Growth to age 3 declined by almost a half an inch since 2012 and may be best explained by the higher density of intermediate size bass in the population. Of the assessment scores, growth showed the biggest drop. The CPUE of age-1 largemouth bass in the sample was low for a second consecutive year, and had a "poor" rating.

The size structure parameters used to assess the fishery by standards set in the Kentucky Lake Fish Management Plan (KLFMP) showed slight increases of smaller ( $<8.0 \mathrm{in}$ ) bass (Table 4). The catch rate of intermediate-size bass ( $12.0-14.9 \mathrm{in}$ ) continues to be above the plan recommendation. The catch rate of harvestable-size bass ( $\geq 15.0 \mathrm{in}$ ) was also up from previous years' data, and above the plan recommendation. However, the catch rate of trophy-size largemouth bass ( $\geq 20.0$ in) was below the KLFMP recommendation.

Proportional Stock Density (PSD) values were calculated for black bass collected from each embayment sampled during the spring (Table 5). The average PSD and $\mathrm{RSD}_{15}$ value for largemouth bass was 88 and 37, respectively. These average values are used in the KLFMP assessment. The PSD value is above the assessment range (55-75; Table 4). This value reflects the higher catch of 12.0 -in and larger bass, in proportion to the catch of small-size bass. The $\mathrm{RSD}_{15}$ value was 37 , which falls inside the targeted range ( $\mathrm{RSD}_{15}$ of 20-40).

During October, 803 black bass were collected by diurnal electrofishing ( 120 PPS, DC current) from four embayments; Blood River, Big Bear, Sugar Bay and Jonathan Creek. Largemouth bass comprised 90\% (90.8 fish/hr) of this sample (Table 6). During the 2015 fall sample, the largemouth bass catch rate was almost 65.0 fish $/ \mathrm{hr}$. In the 2015 sample there was a high catch ( $46.0 \mathrm{fish} / \mathrm{hr}$ ) of small bass ( $\leq 5.0 \mathrm{in}$ ), which represented the bulk of the age 0 -year class. In the 2016 sample, that age class showed up as mostly 6.0-9.0 in bass with a similar catch rate of $46.0 \mathrm{fish} / \mathrm{hr}$.

Length and weight data were recorded from all bass collected during the fall sample to calculate relative weight values. The mean relative weight for harvestable-size largemouth bass was 98 (Table 7). This value was down from the 2015 estimated relative weight value of 107 , though the 30 -year average is 96 . The relative weight of largemouth bass is one parameter that is being watched as an indicator of the increasing population of Asian carp in the lake. As Asian carp numbers continue to increase, they could impact the productivity of the lake and hence the food chain.

Length-weight equations for black bass species at Kentucky Lake are:

| Largemouth bass | $\log _{10}($ weight $)=-3.49275+3.19308 \times \log _{10}$ (length) |
| :--- | :--- |
| Smallmouth bass | $\log _{10}$ (weight $)=-3.46865+3.12256 \times \log _{10}$ (length) |
| Spotted bass | $\log _{10}($ weight $)=-3.15822+3.82582 \times \log _{10}$ (length) |

Otoliths were collected from largemouth bass during fall sampling. Otoliths were used to age bass so that the catch rates of age classes and growth could be evaluated. The CPUE of age-0 largemouth bass during the fall sample was 58.4 fish/hr (Table 8). The 2016 year class appears to be strong, and has excellent growth. The mean length of the age- 0 largemouth bass was 6.4 in by their first fall. The catch rate of age- 0 largemouth bass that were over 5.0 in was at least five times higher than in the previous two years. The high catch rate of age-0 largemouth bass is also evident in Table 9, which indicated over $60 \%$ of the sample were bass from this year class. The back-calculated growth of bass is found in Table 10.

Trap nets were fished for crappie in Blood River and Jonathan Creek embayments for 79 net-nights (nn) during October and November. In addition, Ledbetter Bay was sampled for 39 nn . This is the first time Ledbetter Bay has been sampled for crappie. The combined sampling effort yielded 783 crappie ( $6.6 \mathrm{fish} / \mathrm{nn}$ ), of which 1.4 fish/nn (21\%) were white crappie and 5.2 fish/nn (79\%) were black crappie (Table 11). The Blood River and Jonathan Creek data is listed as "sub-total" on this table. The catch rate was much lower this year as compared to previous years. This is despite a population that should have a high density of intermediate-size crappie, as suggested by strong year classes in 2013-2015. In addition, crappie anglers this fall and early winter reported record catches of legal-size crappie. The low catch in the fall trap nets might have been caused by the unseasonably warm weather. Air temperature was 10-15 degrees warmer this fall as compared to normal fall air temperature. The water temperature was notably warmer; 5-10 degrees this fall.

One of the management objectives in the KLFMP is to maintain a catch rate for crappie (excluding age-0) of 20.0 fish/nn. Using only the Blood River and Jonathan Creek data, this year's sample yielded 8.0 fish/nn (Table 12). This catch rate is down from last year's sample ( 22.7 fish/nn). The above average year classes of 2013 and 2014 are the reason for the overall better catch in 2015. But these fish were likely missed by trap nets during 2016 due to the warmer weather and water temperature.

The number of crappie $\geq 8.0$ in and $\geq 10.0$ in collected in trap nets was 5.3 and $1.4 \mathrm{fish} / \mathrm{nn}$, respectively (Table 12). The KLFMP objective for crappie is to maintain a catch rate of at least 10.0 fish/nn for crappie $\geq 8.0 \mathrm{in}$, and 4.0 fish/nn for crappie $\geq 10.0 \mathrm{in}$. Neither objective was met. Based on the perceived good year classes of 2013-2014, this year's values should have been higher. The low catch is likely due to the warmer weather and water temperatures during the fall sampling season.

Crappie at Kentucky Lake continue to have good growth rates. The growth management objective in the KLFMP is for age- 2 crappie collected in the fall to reach 9.5 inches in length. The average length of the age- 2 crappie collected this year was 9.7 in (Table 12).

Another management objective in the KLFMP is to maintain a catch rate of age- 1 crappie of at least 11.0 fish $/ \mathrm{nn}$ (Table 12). The catch rate for this age group of crappie was $2.9 \mathrm{fish} / \mathrm{nn}$. For the past several years this parameter has been below the management objective due to a number of poor year classes, but did show improvement last year due to the strong 2014 year class.

These parameters are also used as part of the calculation for ranking the crappie fishery at Kentucky Lake. Overall, the crappie population at Kentucky Lake rated "poor" this year (Table 13). This rating is assumed to be an inaccurate account for the crappie population since the catch rates were down, likely due to warmer weather and water temperatures.

The fall trap netting data was used to calculate proportional stock densities and length-weight equations for crappie. PSD and $\mathrm{RSD}_{10}$ values are reported in Table 14. The values are up considerably, and reflect a higher number of intermediate-size crappie in the population from a few good year classes. Length-weight equations for white and black crappie are listed below. Growth is similar to last year's growth.

$$
\begin{array}{ll}
\text { White crappie } & \log _{10}(\text { weight })=-3.26852+2.96265 \times \log _{10} \text { (length) } \\
\text { Black crappie } & \log _{10}(\text { weight })=-3.27568+3.01059 \times \log _{10} \text { (length) }
\end{array}
$$

Tables 15 and 16 list the back-calculated lengths at age for white and black crappie, respectively. The age frequencies for white and black crappie collected are listed in Tables 17 and 18, respectively. The proportion of ages within a given length range is assumed accurate, but the catch rates are low due to poor samples collected.

During the spring of 2016, icthyoplankton sampling was conducted in the Jonathan Creek embayment of Kentucky Lake. Samples were conducted using a rectangular neuston net with a 100-micron mesh size, towed 50 feet behind a boat, at a speed of 1.5 mph . Tow duration was either 5 or 3 minutes depending on an a priori assessment of the expected concentration of icthyoplankton and leptodora to prevent clogging. A General Oceanics flowmeter was attached inside the mouth of the net to record the volume of water sampled during each run. Sampling was begun just after dusk and always followed the same site order. Each sampling event started closest to the main lake site and then progressed farther into the embayment (Appendix C).

Based on results from 2015, one site was eliminated and two sites were added farther into the embayment. Samples were preserved immediately in $10 \%$ formalin or $95 \%$ ethanol and stored in mason jars. All larval fish were sorted and identified to the lowest practical taxon using "A Practical Key to Identify Families, Genera, and Species of Fish Larvae Commonly Collected in Tennessee Reservoirs" (Sammons, 1999); "Preliminary Guide to the Identification of Larval Fishes in the Tennessee River" (TVA, 1976); and "Early Development of Four Cyprinids Native to the Yangtze River, China" (Chapman, and Wang, 2006) (Bolu Yi, et al. 1988). Once identified, fish were counted and measured for total length. In cases of more than 100 individuals in a sample, a random subsample of at least 30 individuals was measured and used to extrapolate the lengths of the fish from the entire sample. Larval crappies were not identified to species due to overlapping myomere counts between both species and their hybrids (Spier and Ackerson, 2004).

The geometric mean and median of the 6 sample sites were used to evaluate overall densities during each week. The standard error and coefficients of variation of the mean and geometric mean were used to evaluate sample accuracy (Table 19). In 2015 the peak weekly density of crappie occurred on May $12^{\text {th }}$ and was 70.50 crappie $/ 1000 \mathrm{~m}^{3}$. In 2016 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was only 3.88 crappie $/ 1000 \mathrm{~m}^{3}$. Although the density of crappie was relatively high during our last sample week (June $9^{\text {th }}$ ), we feel that we captured the majority of the crappie spawn during the sampling timeframe. Based on these results, the spawn of crappie in Jonathan Creek in 2016 appears to have been poor relative to 2015. This will still need to be verified with trap netting in 2017.

In order to determine the hatch dates of crappies more precisely, based on growth rates, all crappie that were 8-11 mm in total length were assumed to represent a one-week cohort (Table 20). Just like last year, crappie in the 8-11 mm range appeared to be fully recruited to the gear, and were well represented in the sample. It is possible that crappie shorter than 8 mm were not located in the pelagic sample sites yet, and that crappie over 11 mm were more likely to avoid capture. This length range was also chosen because an 8 mm crappie would grow to 11.8 mm in one week (our sample interval), based on a growth rate of 0.65 mm per day after swim up. This was our estimated daily growth rate from daily otolith ring counts of Jonathan Creek crappie collected later in the year (next section)

In addition to weekly cohorts, we also estimated daily cohorts of hatched crappie. All crappie that were captured outside of the $8-11 \mathrm{~mm}$ length range were excluded from the hatch date analysis to minimize the effects of gear bias and the longer exposure to natural mortality of older fish (Table 21). A hatch date was then back-calculated for each individual fish using the assumed growth rate ( $0.66 \mathrm{~mm} /$ day $)$ and the total length of each fish. A total length at hatch ( 4 mm ) was factored into the regression for hatch date. This technique has been employed in other systems (Mitzner 1991). An incubation period of 95 hours (based on temperature) was also factored into the regression so that the day when fertilization occurred could be estimated.

The estimated hatching densities indicated that the spawn in Jonathan Creek lasted at least 40 days and extended at least until the end of May (Table 21). Because of our limited larval sampling window, we cannot be sure that crappie did not spawn before or after our sampling window. The literature reports most crappie spawns to be relatively short (1-2 months; Mitzner 1991 and Travnichek, et. al.1996). No strong peaks in successful spawning activity were observed. Unlike last year, the lake did not experience a spring flood. The elevation simply rose steadily following the guidelines established by TVA and the ACOE. A previous study evaluating the factors which affect crappie recruitment in Kentucky Lake found that higher discharge during the spawn and pre-spawn were correlated with good year classes of white crappie. However, black crappie were more likely to be successful during years with relatively low discharge during the spawn and pre-spawn (Martin, 2012). Unfortunately, we cannot tell
from larval data which species had the stronger spawn, but it will be interesting to see whether the class of 2016 for each species will be well represented in our trap net samples in 2017. Similar to last year's survey we found much higher densities of larval crappie farther into the embayment (Table 19; Appendix C).

In June 2016 an effort was made to capture YOY crappie using a benthic otter trawl. Crappie were identified to species using dorsal fin counts, and a subsample of otoliths was collected from approximately 175 crappie for daily ring count analysis. Crappie smaller than 19 mm were often too small to accurately determine species, but were included in analyses that grouped both species together. Crappie trawling has typically been conducted in the fall to assess year class strength. However, an earlier sample was necessary for accurate daily ring counts since those counts can become unreliable in fish >100 days old (Sweatman and Kohler, 1991). Trawling runs were conducted in Jonathan Creek because this is where the larval sampling occurred during the spring. Five trawl sites were chosen to correspond loosely with the larval sampling sites. To evaluate whether hatching periods and growth rates differed by embayment, trawling was also conducted at 6 sites in the Blood River embayment. Otoliths were mounted convex side down using thermoplastic cement, sanded with 1200 grit sandpaper, and polished with 0.3 -micron alumina powder.

Each otolith was aged independently by two readers using a compound microscope at $100 \mathrm{x}-400 \mathrm{x}$ magnification. Reader agreement was typically within 1-2 days, but if the difference between readers was less than $10 \%$ of the fish's age, the counts were averaged and accepted. This technique resulted in 10 fish being excluded from Jonathan Creek, and seven fish being excluded from Blood River. We were able to estimate an average daily growth rate for both species of crappie by using the equation [(total length $\mathrm{mm}-4 \mathrm{~mm}) / \# d a y s$ old -4 days]. This growth rate estimate was coupled with the larval data to provide an accurate estimate of crappie hatch dates in Jonathan Creek as described earlier (Table 19). There is no way to practically differentiate between crappie species in the larval samples. Thusly, the estimated growth rate used in the larval hatch date back calculation combined both species together.

Differences in growth rates and hatch dates between species and embayments were initially compared with an F-test for variances. Due to unequal variances, the hatch dates and growth rates were then compared using T-tests for unequal variances. In Jonathan Creek both black and white crappie had an average hatch date of the $1^{\text {st }}$ of May. However, daily growth rates for black crappie were statistically significantly higher ( $0.68 \mathrm{~mm} /$ day $)$ than white crappie (. $65 \mathrm{~mm} /$ day $)(\mathrm{t}=1.86 \mathrm{df}=40 \mathrm{P}=.03)$.

In Blood River, the average black crappie hatched significantly sooner (May $5^{\text {th }}$ ) than the average white crappie (May $\left.16^{\text {th }}\right)(\mathrm{t}=5.83 \mathrm{df}=31 \mathrm{P}=<.0001)$. However, despite a difference in average hatch dates of 11 days, there was no significant difference in the growth rates of white and black crappie in Blood River.

Surprisingly, there were significant differences between the hatch dates and growth rates of both embayments. Crappie in Blood River had an average daily growth rate of $0.73 \mathrm{~mm} /$ day. This rate was significantly higher than crappie in Jonathan Creek which exhibited a growth rate of $(0.66 \mathrm{~mm} / \mathrm{day})(\mathrm{t}=5.61 \mathrm{df}=123 \mathrm{P}=<.0001)$. The average crappie in Blood River hatched significantly later (May 19 ${ }^{\text {th }}$ ), than the average crappie in Jonathan Creek (May $1^{\text {st }}$ ) $(\mathrm{t}=16.32 \mathrm{df}=91 \mathrm{P}=<.0001)$. The difference in hatch dates may be due to differences in embayment morphology or temperature differences, but we will continue to monitor this in the future. It is also possible that earlier hatched fish in Blood River experienced high mortality before we were able to capture them as juveniles in summer.

Sixteen species were collected in the trawl with gizzard shad being the dominant species (Table 22). A total of 118 white crappie and 22 black crappie were collected in Jonathan Creek. Yellow bass and bluegill were also caught in very high numbers in the same areas as crappie which may indicate a high degree of habitat preference overlap during this life stage. A total of 96 white crappie and 46 black crappie were collected in Blood River.

The catfish population was sampled at Kentucky Lake during June by using low pulse ( 15 PPS) electrofishing along the main lake river channel. A chase boat was utilized to help collect catfish around the electrofishing boat. One dipper was used in each boat. A total of 426 catfish were collected during the 65 electrofishing runs made (Table 23). Each run lasted 300 seconds, for a total sample time of 5.4 hours over a three-day period. Of the samples, blue catfish had the highest catch rate at $63.3 \mathrm{fish} / \mathrm{hr}$, and made up $81 \%$ of the catfish collected. The catch rate is about double what was reported in 2015. Relative weight values are listed in Table 24. The relative weight values are all high, suggesting the fish are healthy.

Otoliths were collected during sampling in 2014. That data was used to extrapolate with this year's data to calculate age frequencies. Age frequency data for blue catfish is presented in Table 25. A high catch rate of age-4 blue catfish collected in 2014, did not equate to a higher catch rate of age-5 in 2015 or age- 6 this year. In this most recent sample, the age 3 and 4 fish made up almost $65 \%$ of the sample.

## Lake Barkley

Black bass were collected by diurnal electrofishing (120 PPS, DC current) during the spring at sampling sites historically used on Lake Barkley. A total of 520 black bass were collected at a rate of 52.0 fish/hr (Table 26). Spotted and smallmouth bass accounted for about $4 \%$ of the total black bass sampled. This week of sampling yielded about half of what was reported from the 2015 study. At best, it was felt that sampling yielded only fair results. One likely cause for sample numbers to be down was the warmer than normal water temperatures during the standardized sampling. Additionally, numbers of smaller-size bass were down in the 2015 study. This might possibly explain the drop in intermediate-size bass during the most recent study. The largemouth bass catch rate was 49.7 fish $/ \mathrm{hr}$ which falls below the ten-year average of 100.2 fish/hr (Table 27).

The overall PSD and $\mathrm{RSD}_{15}$ values for largemouth bass at Lake Barkley, along with values for individual embayments are listed in Table 28. The PSD value (86) is above the objective goal (PSD of 55-75) established in the Barkley Lake Fish Management Plan (BLFMP). This higher value indicates a bass fishery slightly skewed toward larger fish. The $\operatorname{RSD}_{15}$ (51) was also higher than the set goal (20-40). Again, the higher the value the more the population is skewed toward larger fish. The spring catch of small ( $\leq 8.0 \mathrm{in}$ ) largemouth bass has been low the past two years (Table 27). The catch rate of larger ( $\geq 15.0 \mathrm{in}$ ) largemouth bass also dropped back down after having a higher value in 2015.

The lake specific assessment score for Lake Barkley was "fair" (Table 29). The score was "good" for several years prior to 2010. Flood conditions in 2010, 2011, and 2013 as well as drought conditions in 2012 have influenced sampling likely resulting in lower ratings for these years. Although the fishery showed improvement in these ratings
in 2015, the lack of trophy-size ( $\geq 20.0 \mathrm{in}$ ) largemouth bass and the decline in the number of age- 1 fish collected continues to negatively sway these ratings. The annual mortality of largemouth bass older than a year was $33 \%$ as determined using catch-curve regression of fall caught largemouth (Table 29).

During 2015 largemouth bass age and growth data was collected in the fall instead of the spring. This statewide change in sampling procedure was made to simplify the reading of otoliths by eliminating the need to add an unseen annulus onto the outer edge. Age and growth data collected in the fall of 2015 were coupled with spring 2016 data to yield an estimate of the age distribution for largemouth bass which was historically comparable with previous spring samples. This was accomplished by back calculating the lengths of fall captured largemouth bass to their most recent annulus. These back calculated lengths were assumed to be equivalent to lengths of spring caught bass and were used to create a modified age-length key.

Catch rates for spring caught fish by age-class are shown in Table 30. Ages ranged from 0-11 and the dominant age-class was age-1. The low catch rate of age-1 bass reported in 2015, likely explains the unusually low catch of age 2 during this most recent sample.

Largemouth bass were sampled in October to collect length-weight data for condition factors, and to determine the strength of the 2016 year-class. A total of 430 bass were collected, with $83 \%$ being largemouth bass (Table 31). Largemouth bass had a catch rate of 50.7 fish $/ \mathrm{hr}$. These catch rates, much like the spring samples, are about half of what was reported from the 2015 fall sample. Once again, unseasonably warm water temperatures may have led to a lower fall catch rate. Relative weights were determined for all bass, but very few spotted and smallmouth bass were collected (Table 32). The relative weight for harvestable-size ( $\geq 15.0 \mathrm{in}$ ) largemouth bass was 104. The lengthweight equation for largemouth bass at Lake Barkley is:

$$
\log _{10}(\text { weight })=-3.54855+3.23513 \times \log _{10} \text { (length) }
$$

Mean length of the age-0 cohort of largemouth bass was 5.5 in (Table 33). It has been suggested that bass which reach at least 5.0 in by the fall will have a better chance of survival during their first winter. However, this year's catch rate of age-0 largemouth bass ( $22.7 \mathrm{fish} / \mathrm{hr}$ ) is below average.

Trap nets were fished for crappie in Little River and Donaldson Creek embayments for 80 net-nights (nn) during October and November. A total of 895 crappie were collected at a rate of 11.2 fish/nn (Table 34). Additionally, Crooked Creek (LBL) ( 44 nn ) and Eddy Creek ( 40 nn ) were sampled for a total of 84 net-nights. Both Crooked Creek and Eddy Creek provided a good sample ( $16.8 \mathrm{fish} / \mathrm{nn}$ ), and will be sampled again in the future if possible.

White crappie accounted for $54 \%$ of the total catch, and were collected at a rate of 5.5 fish $/ \mathrm{nn}$ (Table 34). Black crappie were collected at a rate of 4.5 fish $/ \mathrm{nn}$. Donaldson Creek and Crooked Creek both contained higher proportions of black crappie than Little River and Eddy Creek (Table 34). For historical comparisons, only data from Little River and Donaldson Creek were used in the standardized population parameters of Lake Barkley crappie in Table 35. The CPUE of harvestable-size ( $\geq 10.0 \mathrm{in}$ ) crappie was slightly higher than the ten-year average at 1.8 fish $/ \mathrm{nn}$. The CPUE of quality-size ( $\geq 8.0 \mathrm{in}$ ) crappie was 4.9 fish $/ \mathrm{nn}$, which is only slightly above the management objective ( $4.0 \mathrm{fish} / \mathrm{nn}$ ) set in the BLFMP.

Crappie collected in trap nets were used to determine stock densities. The PSD (65) and $\operatorname{RSD}_{10}$ (22) of white crappie were higher than reported from the 2015 sample (Table 36). Last year, numbers of small fish where higher, but this year adult fish numbers were higher. The PSD (47) and $\operatorname{RSD}_{10}$ (11) values of black crappie suggest a more balanced size distribution of black crappie.

The length-weight equations of white and black crappie from Lake Barkley are:

$$
\begin{array}{ll}
\text { White crappie } & \log _{10}(\text { weight })=-3.82119+3.50854 \times \log _{10} \text { (length) } \\
\text { Black crappie } & \log _{10}(\text { weight })=-3.68702+3.43040 \times \log _{10} \text { (length) }
\end{array}
$$

Otoliths from 362 crappie were used for age and growth analysis. Ages ranged from 0-6 years for white crappie and $0-5$ years for black crappie (Tables 37 and 38). Growth continues to be good as crappie reached 10.0 in between age 2 and 3. The average length of age-2+ white crappie was 10.6 in, and black crappie was 9.5 in (Table 35). Age frequencies were estimated by combining catch data with age data. The catch of white crappie was dominated by
age- 1 and age- 2 fish suggesting strong year classes from 2014 and 2015 (Table 39). Very few white crappie older than age-2 were collected which is reflective of the very weak year classes observed prior to 2014. Black crappie ages in Little River and Donaldson Creek were dominated by age-1 fish, suggesting a strong spawn in 2015 and a relatively weak 2016 spawn (Table 40). However, when the other embayments were included, age-0 and age-1 catch rates were almost even.

Assessment of the crappie population yielded a rating of "good" at Lake Barkley in 2016 (Table 41). The catch of age- 0 and age- 1 crappie was down from 2015 data, but still ranked favorably. The growth rate rankings dropped slightly. As these fish age, they should help bolster the number of large crappie in the system and increase angler catch rates.

The catfish population was sampled at Lake Barkley during June by using low pulse (15 PPS) boat electrofishing with one dipper along the main lake river channel. A chase boat with one dipper was also utilized to help collect catfish around the electrofishing boat for a total of two dippers. A total of 650 catfish were collected during the 83 electrofishing runs made (Table 42). Each run lasted 300 seconds, for a total sample time of 6.92 hours over a fourday period. Of the sample, blue catfish had the highest catch rate at 80.0 fish $/ \mathrm{hr}$, and made up $82 \%$ of the catfish collected. Flathead catfish and channel catfish are likely underrepresented using this method as these fish were often observed, but were much harder to approach and dip than blue catfish. Relative weight values were near the ideal values of 100 and are listed in Table 43.

Age data from catfish collected in 2014 was used to calculate an age frequency for catfish collected during 2016. Age frequency data is presented in Tables 44 and 45 for blue catfish and channel catfish, respectively. These tables should be used with caution as some larger size classes were unrepresented in 2014, and were therefore excluded from this age frequency data. Of the blue catfish, almost $70 \%$ of the sample consisted of age 2-4 fish.

## Lake Barkley Creel Survey

A random, non-uniform probability, roving creel survey was conducted on the Kentucky portion (45,600 a) of Lake Barkley from 17 February to 09 November 2016. The Kentucky portion of the lake was divided into eight creel areas (Appendix B). The survey was conducted five days per week, six hours per day. One hour each day was randomly chosen to conduct an angler count. The remaining five hours was dedicated to creeling anglers actively fishing. The overall temporal sampling scheme was twenty days per month, consisting of six weekend days and fourteen weekdays. Varying time period probabilities were assigned to each month. Higher geographic probabilities, resulting in more frequent interviews, were assigned to the Little River and Eddy Creek areas from March through May, and October and November, than were assigned to the other six areas. Equal probabilities were assigned to all areas from June to September. An angler attitude questionnaire concerning fishing on Lake Barkley was conducted by the creel clerk throughout the survey period (Appendix C).

During the 2016 creel, the typical angler was a male ( $88 \%$ ) resident ( $72 \%$ ) who was casting ( $57 \%$ ) or still fishing $(39 \%)$ from a boat ( $84 \%$ ) (Table 46). Of the crappie anglers, $39 \%$ used a spider rig (defined as 3 or more poles per angler) for fishing. The average fishing trip for all anglers was 4.3 hours. There was a decline in the number of trips of almost $157 \%$ from the 2012 survey $(229,892)$ to the recent survey $(89,412)$. However, the 2012 survey reported almost a $60 \%$ increase in the number of trips over the 2008 survey $(145,774)$. The number of fish caught was down from the 2012 survey by $230 \%$ while harvested was down $117 \%$. The overall decrease in effort in this most recent survey resulted in low catch and harvest rates. Length frequencies of all harvested or released fish are given in Table 47.

Table 48 includes fish catch and harvest statistics for the 2016 creel survey. Crappie anglers accounted for $24 \%$ of fishing trips to Lake Barkley ( $17 \%$ in 2012, $14 \%$ in 2008). Estimated catch and harvest rates for crappie were down $30 \%$ and $39 \%$ between the 2016 and 2012 surveys, respectively. However, of the crappie caught, $61 \%$ were under harvestable size (Table 49). This higher proportion of sublegal size crappie corresponds to fall trap netting data that suggest good year classes in 2014 and 2015. As is typical, about $72 \%$ of the crappie were caught in March and April (Table 50). Previous surveys on Lake Barkley have only included one method category for crappie anglers using 3 or more poles. As part of our efforts to evaluate harvest by methods, crappie anglers were recorded as using the following methods: casting, still fishing (1-2 poles), spider rigging ( 3 poles), spider rigging ( $4-5$ poles), spider
rigging ( $>5$ poles). During this survey, $39.2 \%$ of crappie anglers used 3 or more poles and had higher catch rates than anglers using fewer poles. Anglers using only 1 or 2 poles had a catch rate of 0.9 fish $/ \mathrm{hr}$. Using three poles, increased anglers catch rate to $1.7 \mathrm{fish} / \mathrm{hr}$. Anglers using 4 or 5 poles caught crappie at a rate of $2.0 \mathrm{fish} / \mathrm{hr}$. The highest catch rate came from those anglers using more than five poles at $4.1 \mathrm{fish} / \mathrm{hr}$.

Black bass anglers accounted for $39 \%$ of all fishing trips to Lake Barkley during 2016 (Table 48). There were 34,944 black bass fishing trips in the 2016 creel. This represented a $69 \%$ decline from the number of trips reported in the 2012 survey. During previous surveys, any bass that was currently in the livewell was recorded as harvested. However, during this year's survey, anglers with bass in the livewell were asked if they intended to release them at the end of the day. In all cases, tournament anglers indicated that they intended to release their fish after the weighin. Additionally some non-tournament anglers simply chose to keep fish in the livewell for photographic or "mock tournament" purposes, but indicated that they would release them at the end of the day. As a comparison with previous surveys, bass kept in livewells by anglers were reported as harvested, even though they would be released at the end of the day. The harvest rate, which included tournament bass, was estimated to be 0.12 bass per hour for anglers actually targeting bass (Table 51). However, when tournament-harvested bass were removed from the actual harvest, the harvest rate dropped to 0.01 bass/hr. Largemouth bass accounted for $95 \%$ of the harvested black bass (Table 52).

About 8\% of all trips were taken to catch panfish during 2016 (Table 48). This value is similar to that reported during the 2012 creel survey, but down $45 \%$ from that reported during the 2008 survey. Likewise, catch and harvest rates were also down. Almost $70 \%$ of the panfish were harvested during May (Table 53). Bluegill and redear sunfish accounted for $99 \%$ of the panfish harvested. Of the bluegill, only $42 \%$ of the fish caught were harvested, while $86 \%$ of the redear sunfish caught were harvested (Table 54).

Catfish anglers accounted for $14 \%$ of all fishing trips on Lake Barkley in 2016 (Table 48). The number of trips for catfish was up $62 \%$ from the 2012 survey, but similar to the 2008 survey. Of all the data from this survey, harvest of catfish was one of the only parameters that increased when compared to results of the 2012 survey. Harvest increased about $12 \%$. Higher numbers of catfish caught were reported in May (Table 55). These were likely anglers targeting channel catfish in the embayments. The total catch of channel catfish was almost double the catch of blue catfish (Table 56).

Only about $2 \%$ of the anglers fishing Lake Barkley during 2016 sought Morones (Table 48). This group includes; white bass, yellow bass, striped bass and hybrids. However, it is likely that most anglers were fishing for white bass and incidentally caught some of these other species. Approximately $65 \%$ of the Morones caught were yellow bass, but white bass made up $65 \%$ of the Morones harvest. There were no reports of anglers targeting Morones in April (Table 57). The high catch during this month was likely due to crappie anglers incidentally catching yellow bass. The creel data indicated that 6,804 yellow bass $\geq 15.0$ in were harvested (Table 58). It is expected that these larger fish where likely hybrid yellow bass (yellow $x$ white cross). Typically, pure strain yellow bass do not grow that large.

## Lake Beshear

Largemouth bass were collected by diurnal electrofishing (120 PPS, DC current) during April at Lake Beshear. Two hundred and fifty-seven largemouth bass were collected at a rate of 102.8 fish $/ \mathrm{hr}$. (Table 59). The catch rate of harvestable-size ( $\geq 12.0 \mathrm{in}$ ) largemouth bass was 67.2 fish/hr (Table 60). One objective in the Lake Beshear Fish Management Plan (LBFMP) is to maintain a catch rate of at least 45.0 fish $/ \mathrm{hr}$ for harvestable-sized largemouth bass. Good year classes in 2011 and 2012 have helped exceed this objective. The catch of age- 1 fish rebounded this year after two poor years. This year the catch of age- 1 has met the plan objective of 10.0 fish $/ \mathrm{hr}$. Other objectives are to maintain high catch rates of bass $\geq 15.0$ and $\geq 20.0$ in. Ideally, these catch rates should be greater than 30.0 and 3.0 fish/hr, respectively. The catch rates for these size classes of bass were above the management objectives. Lake Beshear continues to have a quality bass fishery with high numbers of bass $\geq 15.0 \mathrm{in}$. The fishery rated "excellent" for the past two years (Table 61).

Largemouth bass were collected by diurnal electrofishing (120 PPS, DC current) in October (Table 59). The catch rate ( $83.5 \mathrm{fish} / \mathrm{hr}$ ) was lower than reported during similar sampling the past two years. Sampling conditions were reported to be good. There is no obvious reason why the catch would have been lower. Relative weight data
suggests that the larger bass ( $\geq 15.0 \mathrm{in}$ ) are healthy with regard to their length-weight ratio. The average relative weight value was 93 for these larger bass and 88 for all sizes of bass. The length-weight equation for largemouth bass at Lake Beshear is:

$$
\log _{10}(\text { weight })=-3.60720+3.21641 \times \log _{10}(\text { length })
$$

Otoliths were removed from a subsample of largemouth bass $\leq 10.0$ in to determine the mean fall length of the age- 0 cohort, and determine their catch rate. The catch rate for age-0 largemouth bass was 50.5 fish $/ \mathrm{hr}$ (Table 62). The average length of the age- 0 bass was 4.4 in.

## Lake Pennyrile

Electrofishing for all species of sportfish in Lake Pennyrile was conducted on 29 April 2016. One-hundred and twenty-two largemouth bass were captured at a rate of $122.0 \mathrm{fish} / \mathrm{hr}$ (Table 63). This catch rate is slightly above the 10 -year average of $114.6 \mathrm{fish} / \mathrm{hr}$. The majority of largemouth bass are still below 15.0 in . Only 3 (2\%) bass over 15.0 in were captured in this year's sample. While $16(13 \%)$ were 12.0 in or larger. The catch rate of fish $\geq 15.0$ in ( $3.0 \mathrm{fish} / \mathrm{hr}$ ) is above the 10 -year average (Table 64).

The catch rate of bluegill $\geq 8.0$ in was 41.0 fish $/ \mathrm{hr}$. (Table 65 ). The catch rate for large-size ( $\geq 8.0 \mathrm{in}$ ) redear was above average. Over the past two years, the catch rate of large bluegill and redear sunfish has been above the 10year average. The most probable explanation for this high catch rate is that there are too few large piscivorous predators and too little angler harvest to limit the abundance of large sunfish in the system. This is probably the most desirable situation since Pennyrile Lake is unlikely to develop into a trophy bass fishery.

PSD and RSD values for largemouth bass, bluegill and redear sunfish are listed in Table 66. The PSD value for largemouth bass suggests a population skewed toward small bass. The largemouth fishery is likely stunted. PSD's and RSD's are above average for bluegill and redear, and skewed toward more adult fish.

A lake specific assessment for Pennyrile has not been possible in recent years without good age and growth estimates. In 2011 a small sample of bass were aged. In 2011 the largemouth bass population was rated as "fair" (Table 67). In more recent years, assessments have been completed using the age data from 2011. Age data collection will be attempted in 2017.

Appendix B. Lake Barkley creel survey areas, 2016.

## Appendix C. LAKE BARKLEY ANGLER ATTITUDE SURVEY 2016

1. Have you been surveyed this year? Yes - stop survey

No - continue
2. Name $\qquad$ (Optional) and Zip Code $\qquad$
3. How many times do you fish Lake Barkley each year? $(\mathrm{N}=634)$
First time here $3.5 \% \quad 1$ to $4 \quad 12.8 \% \quad 5-10 \quad 15.5 \% \quad$ More than $10 \quad 69.2 \%$
4. Which species of fish do you fish for at Lake Barkley (check all that apply)?

| Redear 20.6\% | Black Bass 63.2\% | Crappie 51.2\% | Catfish $38.5 \%$ | White bass $11.8 \%$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Bluegill $26.8 \%$ | Yellow bass $1.6 \%$ | Morones $0.6 \%$ | Sauger $0.3 \%$ | Anything $0.2 \%$ |

5. Which one species do you fish for most at Lake Barkley (check only one)? ( $\mathrm{N}=623$ )

Redear 1.4\% Black Bass 49.6\% Crappie 21.5\% Catfish 19.3\% White bass 2.7\% Bluegill 5.3\% Stripers 0.2\%

> -Answer the following questions for each species you fish for - (see question 4)

## Redear Anglers

6. In general, what level of satisfaction or dissatisfaction do you have with redear fishing at Lake Barkley? $(N=103)$

Very satisfied $31.1 \% \quad$ Somewhat satisfied $46.6 \% \quad$ Neutral 12.6\% Somewhat dissatisfied 4.9\%
Very dissatisfied 1.0\% No opinion 3.9\%
6a. If you responded with somewhat or very dissatisfied in question (6) - what is the single most important reason for your dissatisfaction? $(\mathrm{N}=6)$

Number of fish $50.0 \% \quad$ Size of fish 0\% Not happy with regulations 0\% Too many anglers 0\%
Don't know how to catch them 16.7\% Can't find them anymore 16.7\% Water level fluctuations 16.7\%

## Crappie Anglers

7. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Lake Barkley? $(\mathrm{N}=291)$

Very satisfied 16.5\% Somewhat satisfied 46.4\% Neutral 14.8\% Somewhat dissatisfied 14.1\%
Very dissatisfied 3.4\% No opinion 4.8\%
7a. If you responded with somewhat or very dissatisfied in question (7) - what is the single most important reason for your dissatisfaction? ( $\mathrm{N}=52$ )

Number of fish $88.5 \% \quad$ Size of fish 0\% Not happy with regulations 1.9\% Too many anglers 0\%
Fluctuating water levels $5.8 \% \quad$ Other - Muddy water and weather both 1.9\%

## Black Bass Anglers

8. In general, what level of satisfaction or dissatisfaction do you have with the black bass fishing at Lake Barkley? $(\mathrm{N}=377)$ Very satisfied 39.0\% Somewhat satisfied 42.7\% Neutral 10.1\% Somewhat dissatisfied 5.6\%
Very dissatisfied 1.3\% No opinion 1.3\%
8a. If you responded with somewhat or very dissatisfied in question (8) - what is the single most important reason for your dissatisfaction?( $\mathrm{N}=30$ )

Number of fish $80.0 \%$ Size of fish $0 \%$ Not happy with regulations $3.3 \%$ Too many anglers $0 \%$
Other
$\qquad$ can't catch in June, don't know lake, need cleaning station, flood of 2010 - each 3.3\%

## Catfish Anglers

9. In general, what level of satisfaction or dissatisfaction do you have with the catfish fishing at Lake Barkley? $(\mathrm{N}=232)$
Very satisfied 73.3\%
Somewhat satisfied 19.8\% No opinion 3.0\%

## Appendix C. LAKE BARKLEY ANGLER ATTITUDE SURVEY 2016 (continued)

9a. If you responded with somewhat or very dissatisfied in question (9) - what is the single most important reason for your dissatisfaction? $(\mathrm{N}=2)$

Number of fish 50.0\% Size of fish 0\% Not happy with regulations 0\% Too many anglers 0\%
Too much commercial fishing 0\%
Other $\qquad$ too much trash in lake $50.0 \%$

## All Anglers

10. Are you satisfied with the current size and creel limits on all sport fish at Lake Barkley? ( $N=640$ ) Yes $93.3 \% \quad$ No $6.7 \%$

10 a . If you responded "No" to Question 10, which species are you dissatisfied with and what size and creel limits would you prefer?
Creel Limit (CL), Length Limit (LL), Slot Limit (SL)
Crappie - $10 \mathrm{CL}, 15 \mathrm{CL}, 25 \mathrm{CL}, 30 \mathrm{CL}, 12$ " LL, 8" LL, 11"-14" SL, no LL,
Bass - 14 " LL, $8^{\prime}-12^{\prime \prime}$ SL, 14 "-16" SL, keep one bass under $12^{\prime \prime} \mathrm{LL}, 18$ " LL, 14 " LL, all catch and release in April, 3 CL
Bluegill - need CL
Redear sunfish - 30 CL
Yellow bass - no CL
11. Would you support or oppose removing the 30 fish creel limit on yellow bass in Kentucky Lake and Lake Barkley, to allow unrestricted harvest of yellow bass? $(N=641)$

Support 54.4\% Oppose 3.9\% No opinion 41.7\%

11a. If opposed, why would you oppose removing the creel limit? $(\mathrm{N}=25)$
30 is enough $60 \%$, May over harvest $20 \%$, Doesn't matter $4 \%$, Don't know enough 4\%, Don't catch a limit often $8 \%$,
Raise limit 4\%
12. Are you aware that the Kentucky Department of Fish and Wildlife creates and maintains shallow water stakebeds marked with white poles, and deepwater brushpiles marked with white buoys as fish attractors in Lake Barkley? $(\mathrm{N}=641)$
Yes 65.2\% No 34.8\%

If you answered "No" to question 12, please skip to Question 14. Otherwise continue on to Question 12a.
12a. When you fish Lake Barkley, how regularly do you fish around our fish attractors? $(\mathrm{N}=413)$
Always 3.9\% Frequently 23.0\% Occasionally 51.8\% Rarely 11.1\% Never 10.2\%

12b. If you answered "Rarely" or "Never", what is the single most important reason you don't fish around our fish attractors? ( $\mathrm{N}=88$ )

Over fished 18\%, No boat $15 \%$, Just don't $15 \%$, No success 9\%, Fish for other species 9\%, Don't know their location $8 \%$, Wrong water depth $8 \%$, First time to lake $6 \%$, Fishes own stuff $5 \%$, Only during crappie season 3\%, Boat too big 2\%, Get snagged $1 \%$
13. Are you aware that an interactive map is available on the Department's website which shows the locations of our fish attractors and provides a description of the habitat? $(\mathrm{N}=430)$

$$
\text { Yes } 47.9 \% \quad \text { No } 52.1 \%
$$

14. Do you own a GPS device (handheld unit, depthfinder, Smartphone, etc.) that you use for fishing? $(N=641)$

## Appendix C. LAKE BARKLEY ANGLER ATTITUDE SURVEY 2016 (continued)

15. How many bass do you typically harvest from Lake Barkley each year? $(\mathrm{N}=640)$

None $68.9 \% \quad 1-24.5 \% \quad 3-1012.8 \% \quad 10-307.0 \%$ More than 30 1.6\% Every keeper size bass caught 1.4\% Never bass fish 3.8\%
16. When fishing for fun, how often do you hold fish in your livewell with the intent of releasing them at the end of the day? ( $\mathrm{N}=641$ )

Always $0.9 \% \quad$ Frequently $1.9 \% \quad$ Occasionally $5.5 \% \quad$ Rarely $13.1 \%$ Never $78.6 \%$
17. Have you participated in an organized fishing tournament for any species of fish on Lake Barkley within the last 12 months? ( $\mathrm{N}=640$ ) Yes 27.0\% No 73.0\%
18. Are you aware that Asian carps are widely considered to be an excellent fish to eat? $(N=638)$ Yes 60.2\% No 39.8\%

Table 1. 2016 yearly summary of sampling conditions by waterbody, species sampled, and date.

| Water body | Location | Species | Date | Effort | Gear | Weather | Water temp. ${ }^{\circ} \mathrm{F}$ | Water level | Secchi <br> (in) | Water conditions | Pertinent sampling comments |

Table 3. Lake specific assessment for largemouth bass collected at Kentucky Lake from 2007-2016. This table includes the parameter estimates and the individual scores as well as the total score and assessment rating. The final two columns list the instantaneous mortality (Z) and \% annual mortality (A). Only data collected from Blood River, Big Bear, Jonathan Bay and Sugar Bay were used for historical comparison.

Data from 1985 to 2006 is listed in previous annual reports.
Assessment quartiles were updated in 2015, previous years' APR's will list rating based on old assessment ranges.

A age and growth data was not collected this year, therefore used previous age data set estimates.
2010*, 2011* and 2013* samples were hampered by high water levels during flooding, sample was later than normal; overall a poor sample and not all embayments were sampled.

2012* sample was hampered by low water levels during drought.

Rating
5-7 = Poor (P)
8-11 = Fair (F)
12-16 = Good (G)
17-20 = Excellent (E)

| Average | 5.7 |  | 49.2 |  | 36.0 |  | 29.5 |  |

${ }^{\text {A }}$ Data collected by fall (October) diurnal electrofishing. Mean lengths were determined by analysis of otoliths removed from a subsample of LMB <8.0 in and extrapolated to the entire catch of the fall sample. Since 2010, bass up to 10.0 in have been collected for analysis.
${ }^{B}$ Data from diurnal electrofishing samples collected the following spring (April/May).
*2010, 2011 and 2013 spring data was poor due to high water levels.
*2012 spring data was poor due to low water levels.
Data from 1990 to 2006 is listed in previous year reports.

Table 21. Estimated hatch dates of crappies in the Jonathan Creek and Blood River embayments of Kentucky Lake during April, May, and June 2016 obtained with daily ring counts on otoliths from juveniles. In Jonathan Creek, hatch dates were also derived using larval fish lengths back calculated using a growth rate derived from the daily ring counts of juveniles. "\# hatch" represents the time when crappie actually hatched on the nest.
"\#spawned" represents the time when crappie eggs were fertilized. Elevation and discharge at Kentucky Dam also provided. Environmental variables were provided by TVA and Murray State University.

| Jonathan Creek |  |  |  |  | Blood River |  | Environmental variables |  |  |

# NORTHWESTERN FISHERY DISTRICT 

Project A: Lake and Tailwater Fishery Surveys

## FINDINGS

Table 1 presents a summary of conditions encountered while sampling at state-owned or managed lakes and ACOE reservoirs during the 2016 field season.

## Nolin River Lake

## Black Bass Sampling

Spring electrofishing to monitor the black bass population at Nolin River Lake was conducted during May 2016 (Tables 2-5). Catch rates in 2016 were largely consistent with those collected during the last survey in 2014. The most notable difference was the catch rate for $12.0-$ to 14.9 -in fish, which decreased approximately $50 \%$. However, the catch rate of 12.0 - to 14.9 -in fish was above average in 2012 and 2014 and the 2016 catch rate is similar to catch rates collected in previous surveys. Overall, Nolin's largemouth bass population is stable and performing as expected.

## Crappie Sampling

Trap netting was conducted during late October and early November to assess Nolin River Lake's crappie population (Tables 6-10). A total of 971 crappie ( $9.7 \%$ black) were collected in 95 net-nights of effort. The 2016 catch rate for all length groups of white crappie was lower than what is typically collected. Although anecdotal conversations with anglers and conservation officers indicate anglers caught fewer crappie throughout the year, the above average temperature and stable weather conditions encountered during the sampling time period was most likely the contributing factor to the depressed catch rates. White crappie growth rate continues to be very good with white crappie averaging 10.7 in at age $2+$ at capture. This is the second highest growth rate recorded for Nolin. Although trap net sampling indicates the crappie population is not producing as expected, the lower catch rates are to some extent the result of sampling conditions rather than a population decline.

## Dissolved Oxygen - Temperature Profiles

Dissolved oxygen and temperature profiles were conducted in late July 2016 (Table 11). Profiles were completed at three sites (lower, middle, and upper) along the main channel of the lake. These profiles are similar to profiles completed during previous years with dissolved oxygen falling below 3.0 ppm from 14 to 18 feet deep depending on area of the lake.

## Rough River Lake

## Black Bass Sampling

Electrofishing to monitor spring black bass population trends at Rough River Lake was conducted during April 2016 (Tables 12-15). With the exception of 8.0- to 11.9-in largemouth bass, catch rates in 2016 are similar to catch rates documented over the last several years. The lower number of 8.0- to 11.9-in fish may lead to a reduction in harvestable fish in the next couple of years but should be temporary. Overall, largemouth catch rates have remained fairly consistent and the population produces a stable, quality fishery.

## Hybrid Striped Bass Sampling

Gill netting to monitor the hybrid striped bass population was conducted the third week of November (Tables 1620). Catch rates in 2016 were lower than those collected during the last couple of surveys, but are similar to catch rates over the last 10-15 years. The reduced catch rates are most likely the result of warm stable weather during the sampling period coupled with a lower than normal lake level that caused some traditional netting sites to become
inaccessible. Growth rate is excellent with hybrids averaging 17.6 in at age $2+$ in 2016 , which is the highest growth rate documented at Rough River Lake. Gill netting will be conducted annually for the next few years as part of a project to document any differences in survival and growth rate of the reciprocal and original crosses.

Gill netting to assess the channel catfish population was conducted concurrently with hybrid striped bass sampling. A total of 129 channel catfish were collected in 6 net nights for a CPUE of 21.5 fish/net-night which is the highest catch rate for channel catfish recorded (Tables 21-22). Condition is good and similar to prior collections. The higher catch rate for channels appears to be related to the lower than normal lake level at time of sampling. Both the traditional net sites, that typically produce few catfish, and the new sites captured high numbers of channel catfish in 2016.

## Dissolved Oxygen - Temperature Profiles

Dissolved oxygen and temperature profiles were conducted in June, July, and August in 2016 (Tables 23-25). Profiles were conducted at three sites (lower, middle, and upper) along the main channel of the south fork of the lake on each sample date consistent with samples in previous years. An additional site, at the state park beach, was added to the July sample. These profiles were conducted as part of a project to document survival and growth of the original and reciprocal hybrid striped bass crosses stocked at Rough River Lake.

## Carpenter Lake

## Largemouth Bass

Largemouth bass were sampled at Carpenter Lake in April 2016 (Tables 26-29). Catch rates in 2016 rebounded from the near record low catch rates collected in 2015. Catch rates in 2016 for all length groups were well above what is typically collected indicating that, as expected, the depressed 2015 catch rates were due to sampling anomalies rather than any population shift. Catch rate of fish 8.0 - to 11.9 -in was lower than samples from the past 13 years but catch rate of fish 12.0 - to 14.9 -in and $\geq 15.0$ in were among the highest ever collected. We collected more large fish ( $>5$ pounds) in 2016 than in recent memory.

## Bluegill Redear Sunfish Sampling

Electrofishing to assess the bluegill/redear sunfish populations was conducted in May (Tables 30-32). Catch rates for bluegill in 2016 were lower than the last couple of years, but within the range of those collected over the last decade since gizzard shad were first discovered in the lake in 2006. The bluegill population over the last 10 years has been characterized by decreased growth rates and very few fish reaching 8.0 in . Age-growth data collected in October 2015 indicate a mean length at age 2 equal to that collected in 2010, however the 2010 data was a decline of approximately one inch from the 2003 sample collected prior to the gizzard shad introduction. It now takes an estimated 4-4+ years for a bluegill to reach 6.0 in, a decrease from 3-3+ in 2007-2010 and 2-2+ in the early 2000s. Most likely the gizzard shad population is negatively impacting the bluegill population. For unknown reasons gizzard shad eradication efforts conducted in March 2015 and February 2016 were unsuccessful. Alternative methods will be attempted in the future to reduce the number of shad.

Few redear sunfish were collected in 2016. An abundance of water lily during the spring sample made it difficult to capture both bluegill and redear sunfish likely resulting in the lower catch rate.

## Channel Catfish Sampling

Channel catfish were sampled with tandem hoop nets during October (Table 33). Three tandem net sets baited with Zote® soap were fished for three nights resulting in a total of 39 channel catfish collected. Length frequency data is similar to that collected in 2009 and suggest both growth rates and angler utilization remain high.

## Dissolved Oxygen - Temperature Profiles

Dissolved oxygen and temperature profiles were conducted in August and October (Tables 34-35). During the August sample dissolved oxygen levels were $\geq 3.0 \mathrm{ppm}$ down to $\sim 6.5$ feet on the front side of the lake and down to
$\sim 8$ feet on the back side. The October sample was prior to setting hoop nets to ensure the lake had mixed and there was no threat of setting nets below the thermocline.

## Old and New Kingfisher Lakes

Old and New Kingfisher were drawn down December 2012 to complete renovation work. The lakes were allowed to dry during 2013 and renovation work was completed during the summer of 2014. As water levels increased, channel catfish, bluegill and advanced fingerling largemouth bass were stocked in fall of 2015. Standardized sampling to assess fish populations will resume in the spring of 2017.

## Dissolved Oxygen - Temperature Profile

A dissolved oxygen and temperature profile was conducted in August (Table 36). Dissolved oxygen dropped below 3.0 ppm at just over 6 feet. This is an improvement of approximately $4-5$ feet from samples taken during similar time periods prior to the renovation.

## Ken Lake (Peabody WMA)

Low pulse electrofishing was conducted in June of 2016 to sample the blue catfish population in Ken Lake (Table 37). Fifty-seven blue catfish were collected in 1.0 hour of sampling for a CPUE of 57.0 fish $/ \mathrm{hr}$. Fish ranged in size from 17.0 to 43.0 in . Six channel catfish and two flathead catfish were captured in addition to the blue catfish. Low pulse electrofishing will be conducted again in 2017 and otoliths removed from a sub-sample of blue catfish 17.022.0 in for age/growth analysis.

In 2012 the level of Ken Lake was raised 6 feet by connecting a vertical 6-foot stand pipe via a 90 degree elbow to the existing horizontal outflow pipes. During June 2016 one of the two water control structures failed when the stand pipe elbow became dislodged from the horizontal outflow pipe. The level of Ken Lake fell approximately 5-6 feet back to the level of the original outflow pipe. Engineering division personnel have investigated and current plans are to contract the repair work, which should be completed in 2017.

Table 1. Annual summary of sampling conditions by waterbody, species sampled and date for Northwestern Fishery District lakes during 2016.

| Water body | Species | Date | $\begin{gathered} \text { Time } \\ (24 \mathrm{hr}) \end{gathered}$ | Gear | Weather | Water temp. F | Water level | Secchi <br> (in) | Conditions | Pertinent sampling comments |

# SOUTHWESTERN FISHERY DISTRICT 

Project A: Lake and Tailwater Fishery Surveys

## FINDINGS

Lake sampling conditions are summarized in Table 1.

## Barren River Lake (10,000 acres)

## Black Bass

Black bass were collected with diurnal electrofishing in April from both lake arms (Tables 2-5). A total of 679 black bass were collected at a rate of $113.2 \mathrm{fish} / \mathrm{hr}$ (Table 2). The overall catch rate for largemouth bass ( 95.5 fish $/ \mathrm{hr}$ ) was the lowest catch rate since 2009 (Table 3). Largemouth bass made up $84 \%$ of the total catch while spotted bass made up $16 \%$ (Table 2) and their distribution remains tied to the lower $1 / 3$ of the reservoir. No smallmouth bass were collected in this year's spring sample. Though the 2015 year class appears weak (age-1 CPUE $=8.0$ fish/hr; Table 4), the bass population assessment rated "Good". Largemouth bass size structure indices (PSD $=81$ and $\mathrm{RSD}_{15}=27$; Table 5) were higher than previous year averages. Spotted bass size structure remains high quality as well ( $\mathrm{PSD}=90$ and $\mathrm{RSD}_{14}=24$ ). The smallmouth bass population statistics are unknown as samples historically have been low.

Fall young of year sampling (Tables 6 and 7) suggests that the 2016 year-class will be strong. Largemouth bass made up the majority of the fall sample ( $98 \%$ ), while spotted bass only made up $2 \%$ of the sample (Table 6). No smallmouth bass were collected in this year's fall sample. Age-0 CPUE (191.8 fish/hr; Table 7) was high compared to most years. Age-0 largemouth bass mean length ( 4.3 in ) was average compared to most years, as was age- 0 CPUE $\geq 5.0$ in ( $46.5 \mathrm{fish} / \mathrm{hr}$ ).

Creel Survey: Results of a roving, daytime creel survey are presented in Tables 8-18. Anglers made an estimated 38,867 trips and fished for 162,756 hours with an average trip length of 4.19 hours. The number of trips is down from the 2010 creel survey ( 42,171 in 2010) and anglers caught 14,969 less fish, but 37,707 more fish were harvested compared to 2010 (Table 8). Overall, anglers caught 224,156 fish and harvested 97,207 of the fish caught. Black bass continue to be the most sought after fish species, accounting for $47 \%$ of effort followed by crappie (33\%), anything ( $6 \%$ ), and catfish and morone at 5\% each (Table 9).

Bass angler trips $(18,097)$ and the hours fished for bass $(75,782)$ increased from the 2010 creel survey $(16,683$ and 70,027 , respectively) but the catch rate ( $0.47 \mathrm{fish} / \mathrm{hr}$ ) was down from 2010 ( $0.72 \mathrm{fish} / \mathrm{hr}$; Tables 9 and 11). The estimated 31,315 largemouth bass caught is a decrease from the 65,300 caught in 2010 , however, the estimated harvest for $2016(8,670)$ increased from $2010(6,677$; Table 15).

Crappie angler trips $(12,980)$ increased by 2,967 over the 2010 creel and the number of hours fished for crappie increased by 12,323 ( 54,354 hours in 2016; Table 9). Crappie catch rate ( $2.57 \mathrm{fish} / \mathrm{hr}$ ) and harvest rate ( $1.15 \mathrm{fish} / \mathrm{hr}$ ) were up when compared to the previous two (2007 and 2010) creel surveys (Table 12). The crappie catch was dominated by white crappie at $83 \%$ ( 115,195 fish) and $44 \%$ of the white crappie caught were harvested (50,767 fish; Table 16).

Morone angler trips $(1,956)$ and the hours fished for morone $(8,192)$ both decreased by $45 \%$ from the 2010 creel survey (Table 9). The Morone catch rate ( $0.45 \mathrm{fish} / \mathrm{hr}$ ) was also down from 2010 while the harvest rate ( 0.27 fish/hr) remained the same (Table 13). The morone catch was dominated by hybrid striped bass ( $66 \%$ ) and over half ( $62 \%$ ) of the fish harvested were $\geq 15.0$ in (Table 17).

Catfish anglers trips $(2,078)$ and the hours fished for catfish $(8,704)$ decreased from the 2010 creel survey $(3,169$ and 13,303 , respectively; Table 9 ). The estimated 12,902 catfish caught is a slight increase from the 11,952 caught in 2010, however, the estimated harvest for $2016(9,760)$ increased greatly from $2010(894$; Table 14). More channel catfish were caught $(8,197)$ than either blue catfish $(4,135)$ or flathead catfish $(554)$, but of those channel catfish
caught, only $71 \%$ were harvested; while $84 \%$ of the blue catfish and $91 \%$ of the flathead catfish caught were harvested (Table 18).

Angler Attitude Survey: Angler attitude results are presented in Figure 1. Anglers identified bass (44.3\%) and crappie $(41.5 \%)$ as the species they fished for most followed by catfish ( $5.2 \%$ ) and hybrid striped bass $(5.2 \%)$, which both decreased from the 2010 angler attitude survey. Overall satisfaction (very satisfied to somewhat satisfied) for bass, crappie, hybrid striped bass, and catfish ranged from 69-84\%.

Response of all anglers to removing the 30 fish creel limit on yellow bass included $34.3 \%$ supporting and $63.3 \%$ with no opinion. Of the crappie anglers unhappy with fishing regulations, $68.8 \%$ prefer a 10.0 -in size limit while others would prefer a 20 fish ( $60 \%$ ) or 15 fish ( $30 \%$ ) daily creel limit. Overall, few anglers expressed dissatisfaction with current regulations.

Most of the anglers (79\%) were aware that KDFWR places fish habitat in Barren River Lake. Of those aware of the fish attractors, $60.9 \%$ fished them and the majority of anglers ( $82.7 \%$ ) feel that they improve their fishing results. Over half of anglers using KDFWR placed fish attractors ( $52.6 \%$ ) found them on their own and about half ( $47.3 \%$ ) were not aware that all of the department placed fish attractors are on the KDFWR website.

Most anglers (66\%) fished Barren River Lake with regularity (more than 10 time annually) and not surprisingly, the majority of Kentucky anglers ( $70 \%$ ) that fished Barren River Lake traveled less than 30 miles. In-state anglers traveling greater than 30 miles comprised $19.2 \%$ of anglers. Six states were represented by out-of-state anglers $(\mathrm{n}=36)$ comprising $10.8 \%$ of anglers with the majority coming from $\mathrm{IN}(14 \%), \mathrm{OH}(31 \%)$ and $\mathrm{TN}(28 \%)$.

## Briggs Lake (18 acres)

## Black Bass

Nocturnal largemouth bass electrofishing samples were collected in April (Tables 19-21). The catch rate (262.4 fish/hr) was up slightly from the last time largemouth bass were sampled in 2012, but still lower than the samples of 2007-2011, which averaged 414.0 fish/hr (Table 20). The PSD value (42) was higher than in 2012 due to a drop in the 8.0 - to 11.0 -in length group ( 138.0 to $121.2 \mathrm{fish} / \mathrm{hr}$ ) and an increase in the 12.0 - to 14.9 -in and $\geq 15.0$-in length groups in 2016 (increase of 28.8 and 13.2 fish $/ \mathrm{hr}$, respectively; Tables 20 and 21). Since the lake is managed for bluegill/redear sunfish, the bass population assessment table was not included.

## Channel Catfish

Channel catfish were sampled with tandem set hoop nets in late-October with limited success ( 5.2 fish/set-night) as few non-stocker-sized fish were collected (Table 22). Due to the lack of non-stocker-sized fish, other population assessment indices (age, relative weight, length group catch rates) were omitted. Dissolved oxygen levels remained $\operatorname{good}(>7 \mathrm{ppm})$ throughout the sampling period and were not a factor in low catch rates. Larger redear sunfish were well represented in hoop net samples and are a good source for an older-larger fish age sample.

## Fagan Branch Reservoir (140 acres)

## Black Bass

Largemouth bass were sampled by nocturnal electrofishing in May (Tables 23-26). The overall largemouth bass catch rate ( $279.0 \mathrm{fish} / \mathrm{hr}$; Table 23) improved since the last sample in 2013, but remains lower than the samples of 2005,2007 , and 2010 which had an average catch rate of 355.7 fish/hr. The majority of the fish sampled were in the <8.0-in and 8.0 - to 11.9 -in length groups ( 82.0 and 174.0 fish $/ \mathrm{hr}$, respectively), while the 12.0 - to 14.9 -in length group ( 17.0 fish/hr) dipped to its lowest level since 1999 (Table 24). The bass population assessment rates as "Good" (Table 26). The lake's low productivity and its obligation to remain so (back up water supply lake for city of Lebanon) remains a handicap for bass growth and size structure improvements.

## Sunfish

Bluegill and redear were sampled by nocturnal electrofishing in May (Tables 27-32). Despite the lake's low productivity, it has historically supported a good bluegill and redear fishery. Overall CPUE for bluegill (248.5 fish $/ \mathrm{hr}$ ) was average when compared to previous years but the overall redear CPUE ( $56.9 \mathrm{fish} / \mathrm{hr}$ ) was at its lowest level since 2001 (Tables 27-29). The majority of the redear sampled were in the $\geq 8.0$-in length group ( $41.9 \mathrm{fish} / \mathrm{hr}$ ), which was up from 2010, while the 6.0 - to 7.9 -in length group ( 10.5 fish $/ \mathrm{hr}$ ) was down from 2010 ( 62.9 fish $/ \mathrm{hr}$ ). Size structure for both populations was very good (bluegill PSD $=77$, redear $\operatorname{PSD}=89$; Table 30). The bluegill and redear population assessments remain "Good", similar to previous years (Tables 31 and 32).

## Marion County Lake ( 25 acres)

## Black Bass

Nocturnal largemouth bass electrofishing samples were collected in April (Tables 33-36). The overall catch rate of bass ( 332.6 fish $/ \mathrm{hr}$ ) increased from the 2013 sample even though it was still slightly below the management objective of 385.0 fish $/ \mathrm{hr}$ (Table 34). Bass PSD (18) was lower than in 2013 and the population is dominated by fish $<12.0$ in even though there was an increase in the catch rate of $\geq 15.0$-in fish ( $25.1 \mathrm{fish} / \mathrm{hr}$; Tables $34-35$ ). The bass population assessment remains "Good" which is similar to previous years even though the lake is managed for quality-sized sunfish (Table 36).

## Sunfish

Diurnal electrofishing results for bluegill and redear sunfish are presented in Tables 37-42. The overall catch rate for bluegill ( 340.0 fish $/ \mathrm{hr}$ ) decreased from 2014 while the catch rate for redear ( $82.0 \mathrm{fish} / \mathrm{hr}$ ) remained the same (Tables 37-39). The catch rate of $\geq 6.0$-in bluegill ( $150.0 \mathrm{fish} / \mathrm{hr}$ ) was the highest seen since 2005 and the catch rate of $\geq 8.0$-in bluegill ( $9.0 \mathrm{fish} / \mathrm{hr}$ ) was up since the 2011 sample; these factors resulted in an "Excellent" rating in the population assessment (Table 41). The size structure of both populations was very good (bluegill PSD $=52$, redear PSD $=76$ ) when compared to previous years (Table 40). The catch rate of $\geq 8.0$-in redear ( $52.0 \mathrm{fish} / \mathrm{hr}$ ) increased from the previous sample in 2014 and was double the management objective of $25.0 \mathrm{fish} / \mathrm{hr}$ (Table 39). The redear population assessment rated "Excellent" even though the catch rate of $\geq 10.0$-in fish ( 2.0 fish $/ \mathrm{hr}$ ) dropped from the 2014 sample (Table 42).

## Green River Lake (8,210 Acres)

## Muskie

Muskellunge sampling continues to be problematic as multiple attempts (Table 1) were made with electrofishing and standard crappie trapnets in 2016. Samplings results were not reflective of the current population (2014 angler attitude survey and angler catch rates) or historic sampling norms. Sample data and analysis can be found in the Kentucky Annual Performance Report for Statewide Fisheries Investigation Project, Subsection III, DJ Grant Number F40, Segment 39. Muskie-sized trapnet sampling will continue to be coordinated with surrounding states that utilize these nets as well as modification of electrofishing timing to find a reliable gear to assess the population.

## Black Bass

Nocturnal bass electrofishing was conducted on the upper and lower ends of each lake arm (Green River and Robinson Creek) during late-April and early-mid May (Table 43). Low catch rates of the last 2 year classes (fish $<11.0 \mathrm{in}$ ) has caused largemouth bass catch rates to drop off from previous years. Catch rate of largemouth bass $\geq 15.0$ in ( $40.0 \mathrm{fish} / \mathrm{hr}$ ) is still well above average (Table 43).

Largemouth bass size structure indices were similar to previous years' values ( $\mathrm{PSD}=83$; RSD $=50$; Table 45). The population assessment for largemouth bass remained "Good" which is similar to most years (Table 46).

Spotted bass catch rate ( $32.0 \mathrm{fish} / \mathrm{hr}$ ) was similar to last year, but lower than historic levels (approximately 50.0 fish $/ \mathrm{hr}$ ). The population continues to produce fish $>12.0$ inches in length, which was rare prior to alewife introduction in 2004, when few spotted bass achieved such lengths.

Fall YOY sampling (Tables 47-48) suggests another decent largemouth bass year class for 2016. Mean age-0 largemouth bass length ( 5.1 in ) and age-0 CPUE $\geq 5.0$ in ( $55.3 \mathrm{fish} / \mathrm{hr}$ ) were both well above average.

## Crappie

Trap netting for crappie was conducted during late-November to early-December (Table 1). The white crappie population remains heavy laden with 6.0- to 7.0-in fish from the 2014 bumper year class, which was not detected by 2014 trap net sampling. Black crappie, though still low density, continue to rise in number compared to a complete absence historically ( $\mathrm{n}=31$; Table 49). White crappie size structure index ( $\mathrm{PSD}=27$; Table 50) reflects dominance of smaller fish. The long string of moderately-strong year classes of 2008, 2010, 2011, 2012, 2013 and 2014 was finally broken with a very weak 2015 year class. Diminished mean age- $2+$ size ( 7.5 in ) of white crappie is a notable departure from previous years, but reflective of a strong 2014 year class (Table 52). Age- $2+$ crappie lengths in years prior to the persisting population increase were typically 9.0 -in plus. The white crappie population assessment remained "Fair" due to poor growth rates and suspect use of age-0 catch rate as a population assessment objective. The length-weight equation for white crappie in 2016 was similar to previous years:

$$
\log _{10}(\text { weight })=-3.84252+3.51708 \times \log (\text { length })
$$

## Metcalfe County Lake (22 acres)

## Black Bass

Largemouth bass were sampled by diurnal electrofishing on April 28 (Table 1); results are presented in Tables 5355. Bass CPUE ( $148.0 \mathrm{fish} / \mathrm{hr}$ ) was less than recent years ( $2014=198.0 \mathrm{fish} / \mathrm{hr}$ and $2013=234.0 \mathrm{fish} / \mathrm{hr}$ ) despite the addition of 258 largemouth bass (6.0-12.0 in) in early July of 2013. Possible confounding factors included stocking on top of an already well above average number of 8.0-11.9 in fish and fish stocked coming from a high visibility lake (secchi depth 16 -ft vs $2-\mathrm{ft}$ at Metcalfe). The size structure remains diverse ( $\mathrm{PSD}=39, \mathrm{RSD}=25$; Table 55) and similar to previous years. CPUE of 20.0-in plus fish returned to more normal levels ( 10.0 fish/hr) compared to an extraordinary high noted in 2014 ( 26.0 fish $/ \mathrm{hr}$ ). The lake consistently averages 6.0-8.0 fish $/ \mathrm{hr}$ for this length group, which is well above any waterbody in the Southwest District.

Visible condition of all bass appears excellent and is similar to historic values (2000-2002; $\mathrm{Wr}=105$ ). The lake is highly productive and supports a substantial and varied forage base (gizzard shad, bluegill, and longear sunfish) making it a good candidate for a bump in the bass population; yet the effects of stocking additional bass in 2013 were not seen 10 months later in spring of 2014, nor in subsequent years.

## Bluegill

Results of the diurnal bluegill sampling on May 6 are presented in Tables 1 and 56-59. A decrease in size structure as well as lower CPUE's of all length groups were noted except for smaller fish ( $<3.0-\mathrm{in}$ ) when compared to historic data (Table 57). Size structure index (PSD = 37) for bluegill was similar to historic values (PSD = 47 in 2014, PSD $=39$ in 2007, PSD = 32 in 2005). Declines in intermediate-size bass ( $8.0-$ to 11.9 and $12.0-$ to 15.0 -in) would seem to be the driving factor for this change. The bluegill population assessment remained "Fair", similar to previous years, hindered by the absence of larger fish ( $\geq 8.0$ in).

As mentioned earlier, the lake is very productive (summertime secchi range is $18-30 \mathrm{in}$ ) and historically supports a substantial (bluegill CPUE > 1200+ fish/hr) and varied (bluegill, crappie, and longear) sunfish population along with a moderate gizzard shad population.

## Mill Creek Lake (109 acres)

## Sunfish

Results of diurnal sunfish electrofishing on May 6 are presented in Tables 60-63. The overall bluegill CPUE (639.0 fish/hr) was similar to previous years (Table 61). The bluegill population size structure remains dominated by intermediate-sized fish ( 549.0 fish/hr; PSD = 5), similar to previous years (Tables 61-62). The population assessment remains "Poor" (Table 63), though the bass population is well balanced. The presence of a substantial gizzard shad population would seem the likely factor hindering population improvement.

## Spurlington Lake (25 acres)

## Black Bass

Results of nocturnal largemouth bass electrofishing collected on April 19 are shown in Tables 64-67. Larger bass length groups were well above normal ( $12.0-$ to $14.9-\mathrm{in}=206.0 \mathrm{fish} / \mathrm{hr}$; $\geq 15.0-\mathrm{in}=84.0 \mathrm{fish} / \mathrm{hr}$; Table 65 ), while intermediate-sized fish ( 8.0 - to $11.9-\mathrm{in}$ ) dipped below population norms (Table 65). The bass population, though still diverse, is dominated by larger fish $(\mathrm{PSD}=75, \mathrm{RSD}=22$; Table 66).

## Sunfish

The sunfish population was sampled by diurnal electrofishing on May 5 (Table 1 and Table 68). Intermediate-size bluegill length group catch rates ( $3.0-$ to $5.9-\mathrm{in}=276.0 \mathrm{fish} / \mathrm{hr}$; 6.0 - to $7.9-\mathrm{in}=92.0 \mathrm{fish} / \mathrm{hr}$ ) were significantly lower than recent years (Table 69). Increases in larger bass length groups noted previously seem a likely contributor to this. Similarly, reductions in redear catch rates for all length groups may be related to increased densities of larger bass (Table 70). Bluegill size structure remains diverse and similar to previous years (PSD = 27; Table 71). The bluegill population assessment dipped to "Good" due to a drop in large fish catch rates (Table 73), but was similar to most years. Bluegill mean back calculated length at age 2 ( 3.9 in ; Table 72) was similar to previous age data collected in 2008 ( 3.8 in ; Table 73). A redear population assessment is not available due to the lack of fish numbers for suitable age data.

Table 1. Lake sampling conditions in the Southwestern Fisheries District in 2016.

| Lake | Date | Species | Weather | Water temp. surface (F) | Conductivity (umhos) | Secch <br> (in.) | Comments |

Figure 1.
Barren River Lake Angler Attitude Survey 2016 (n=333)
For "part a or b" questions, the clerk is to categorize the respondent's answer and check the appropriate box.

1. Have you been surveyed this year? Yes - stop survey No - continue
2. Name \& Zip Code: $<30$ miles $(70 \%)>30$ miles $(19.2 \%)$ out of state $(10.8 \%, 6$ states $)$
3. How often do you fish Barren River Lake in a year? (If "First time", go to question 14)

First time - (4.2\%) 1 to $4-(18.0 \%) \quad 5$ to $10-(11.9 \%) \quad$ More than $10-(65.9 \%)$
4. Which species of fish do you fish for at Barren River Lake (check ALL that apply)?

Bass - (57.1\%) Crappie - (63.1\%) Hybrid Striped Bass - (15.9\%) Catfish - ( $14.4 \%$ )
Anything - (4.5\%) Bluegill - ( $0.9 \%$ ) Walleye - $(0.3 \%)$
5. Which one species do you fish for most often at Barren River Lake (check only ONE)?

Bass - (44.3\%) Crappie - (41.5\%) Hybrid Striped Bass - (5.2\%) Catfish - (5.2\%)
Anything - (2.1\%) Bluegill - (1.7\%)
-Ask the following questions for each species the anglers fish for - (see question 4)

## Bass Anglers

6. What level of satisfaction do you have with BASS fishing at Barren River Lake? ( $\mathrm{n}=201$ )

Very satisfied - $30.8 \%$ ) Somewhat satisfied - (38.3\%) Neutral - (15.9\%)
Somewhat dissatisfied - (10.4\%) Very dissatisfied - (2.0\%) No opinion - (2.5\%)
6a. If angler responds with somewhat or very dissatisfied:
What is the single most important reason for your dissatisfaction? $(\mathrm{n}=28)$
Number of fish - (30.3\%) Size of fish - (14.3\%) Tournaments - (17.8\%) Misc. - (28.6\%)
6b. If angler responds that they are unhappy with the regulations (6a.):
What type of regulation would you prefer to see on bass at Barren River Lake?
minimum size limit ( $n=2$ )
15 inch - (50.0\%)
18 inch - (50.0\%)

## Crappie Anglers

7. What level of satisfaction do you have with CRAPPIE fishing at Barren River Lake? ( $\mathrm{n}=212$ )

Very satisfied - $(43.9 \%) \quad$ Somewhat satisfied - $(40.1 \%) \quad$ Neutral - $(5.7 \%)$
Somewhat dissatisfied - (6.6\%) Very dissatisfied - $(0.9 \%) \quad$ No opinion $-(2.8 \%)$
7a. If angler responds with somewhat or very dissatisfied:
What is the single most important reason for your dissatisfaction? $(\mathrm{n}=16)$
Number of fish - (43.8\%) $\quad$ Size of fish - (31.3\%) $\quad$ Regulations - (6.3\%) Misc. - (18.8\%)

7b. If angler responds that they are unhappy with the regulations (7a.):
What type of regulation would you prefer to see on crappie at Barren River Lake?
minimum size limit $(\mathrm{n}=16)$
8 inch - (6.3\%)
10 inch - (68.8\%)
15 inch - (6.3\%)
Current - (18.6\%)
fish daily creel limit $(\mathrm{n}=10)$
15 fish - (30.0\%)
20 fish - (60.0\%)
25 fish - (10.0\%)

## Hybrid Striped Bass Anglers

8. What level of satisfaction do you have with HYBRID STRIPED BASS fishing at Barren River Lake? ( $\mathrm{n}=57$ )
Very satisfied - (24.6\%) Somewhat satisfied - (47.4\%) Neutral - (17.5\%)
Somewhat dissatisfied - (5.3\%) Very dissatisfied - (1.8\%) No opinion - (3.5\%)
8a. If angler responds with somewhat or very dissatisfied:
What is the single most important reason for your dissatisfaction? $(\mathrm{n}=5)$
Number of fish - (100.0\%)
9. What type of hybrid fishing would you prefer at Barren River Lake? (read them options below) ( $\mathrm{n}=26$ )

Catch/harvest larger, but fewer fish - (46.2\%) Catch/harvest more fish, but fewer larger fish - (34.6\%) No Preference - (19.2\%)

## Catfish Anglers

10. What level of satisfaction do you have with CATFISH fishing at Barren River Lake? ( $\mathrm{n}=49$ )

Very satisfied - (42.9\%) Somewhat satisfied - (36.7\%) Neutral - (12.2\%)
Somewhat dissatisfied - (2.0\%) Very dissatisfied - (0\%) No opinion - (6.1\%)
10a. If angler responds with somewhat or very dissatisfied: What is the single most important reason for your dissatisfaction? $(\mathrm{n}=1)$

Not enough access - (100.0\%)
11. What methods do you use fishing for CATFISH at Barren River Lake? (check all that apply) ( $\mathrm{n}=24$ )

Traditional Hook and Line - $\mathbf{( 7 5 . 0 \%}$ ) Hand-fishing - (8.3\%) Floating Jugs - (16.7\%)
12. How many days per year do you use each method at Barren River Lake? (ask only those checked above) Traditional Hook and Line ( $\mathrm{n}=16$ )

$$
\begin{aligned}
& \geq 10 \text { days }-(50.0 \%) \\
& 11-20 \text { days }-(18.8 \%) \\
& 21-30 \text { days }-(31.2 \%)
\end{aligned}
$$

Hand-fishing ( $\mathrm{n}=2$ )
10 days $-(50.0 \%)$
20 days - (50.0\%)
Floating Jugs ( $\mathrm{n}=3$ )

$$
\begin{aligned}
& 5 \text { days }-(33.3 \%) \\
& 10 \text { days }-(33.3 \%) \\
& 12 \text { days }-(33.3 \%)
\end{aligned}
$$

13. What type of catfish fishing would you prefer at Barren River Lake? (read them options below) ( $\mathrm{n}=22$ ) Catch/harvest larger, but fewer fish $-(36.4 \%) \quad$ Catch/harvest more fish, but fewer larger fish $-(31.8 \%) \quad$ No Preference (31.8\%)

## All Anglers

14. Would you support or oppose removing the 30 fish creel limit on yellow bass at Barren River Lake? ( $\mathrm{n}=332$ ) Support - (34.3\%) Oppose - $2.4 \%$ ) No Opinion - (63.3\%)
15. Were you aware KDFWR places fish habitat (e.g. fish attractors/structures) within the lake? ( $\mathrm{n}=328$ ) Yes - $(79.0 \%) \quad$ No - $21.0 \%$ ) (If no, mention fish attractor maps available (website or give them one) then go to \#18)
16. Do you regularly fish Department placed attractors/structures at Barren River Lake? ( $\mathrm{n}=261$ ) Yes - (60.9\%) No (39.1\%) (if no go to \#17)

16a. How did you find these attractors/structures? (check all that apply) ( $\mathrm{n}=211$ ) On my own - $(52.6 \%) \quad$ Friend/word of mouth - (23.2\%) KDFWR website - (15.6\%)
Hotspots maps - $5.2 \%) \quad$ KY Afield $-(0.9 \%) \quad$ TV - $(0.9 \%) \quad$ Barren river blog - $(0.5 \%)$
Navionics - (0.5\%)
16b.Do you feel the addition of Department placed attractors/structures has improved your fishing results? ( $\mathrm{n}=179$ ) Yes - (82.7\%) No - (8.9\%) No opinion - (8.4\%)
17. Were you aware that the locations of all Department placed attractors/structure are available on KDFWR website? ( $\mathrm{n}=260$ ) Yes - (52.7\%) $\quad$ No - (47.3\%)
18. Do you have any questions or comments about the $\qquad$ (substitute answer from \# 5) fishery at Barren River Lake?

Change crappie size limit to 10 " $(\mathrm{n}=59)$
Change crappie creel limit to $20(\mathrm{n}=18)$
Change crappie creel limit to $15(\mathrm{n}=16)$
Too many/limit bass tournaments ( $\mathrm{n}=21$ )
Bass population/\#'s down ( $\mathrm{n}=13$ )
Stock smallmouth ( $\mathrm{n}=8$ )
Fish attractor placement ( $\mathrm{n}=11$ )

- Fish attractors geared toward crappie \& bluegill anglers, spread them out more $(\mathrm{n}=3)$
- Need some for winter pool $(\mathrm{n}=3)$
- Public input on placement $(\mathrm{n}=1)$
- Put more out on main lake $(\mathrm{n}=1)$
- Too many at Port Oliver access area; put in other areas $(\mathrm{n}=1)$
- Put in more attractors ( $\mathrm{n}=1$ )
- Mark attractors with bouys $(\mathrm{n}=1)$

Many more ( $\mathrm{n}=1$ ) comments, but these were omitted for space contraints.

# CENTRAL FISHERIES DISTRICT 

## Project A: Lake and Tailwater Fishery Surveys

FINDINGS

Lake sampling conditions for 2016 are summarized in Table 1.

## Taylorsville Lake (3,050 acres)

Spring diurnal electrofishing was completed in April 2016 to assess the black bass population. Three sections (Big Beech Creek, Ashes/Jacks Creek, and Van Buren area) of Taylorsville Lake were sampled for 7.5 hours ( 2.5 hours per section; 30-minute runs). Length distribution and CPUE for largemouth bass are presented in Tables 2 and 3. The catch rate of bass collected in 2016 ( 218.7 fish/hr) was the highest ever recorded at Taylorsville Lake (historical average is $114.6 \mathrm{fish} / \mathrm{hr}$ ). Catch rate for keeper bass ( $\geq 15.0 \mathrm{in}$ ) was $44.8 \mathrm{fish} / \mathrm{hr}$; higher than the lake average ( 17.6 fish $/ \mathrm{hr}$ ) and was the highest catch rate recorded for harvestable-size fish. Ashes Creek continues to be the area with the highest catch rate for largemouth bass. The PSD for largemouth bass was 71, which was higher than the lake's average of 56 (Table 4). Additionally, the $\mathrm{RSD}_{15}$ value was 22 ; equal to the lake's average. The largemouth bass population assessment score, based on spring electrofishing data, was 17 ("Excellent"), which is higher than the average rating of "Good" at Taylorsville Lake (Table 5).

Length frequency, relative weights, and index of year class strength at age- 0 and age- 1 of largemouth bass based on September electrofishing are presented in Tables 6-8. Average body condition for largemouth bass was good in $2016\left(\mathrm{~W}_{\mathrm{r}}=92\right)$, but was slightly lower than the historical average $\left(\mathrm{W}_{\mathrm{r}}=96\right)$ (Table 7). Catch rate of age-0 largemouth bass in the fall of 2016 ( 49.3 fish $/ \mathrm{hr}$ ) was higher than the lake's historic average of 41.9 fish $/ \mathrm{hr}$ (Table 8). The year class strength model indicated above average recruitment for young-of-the-year largemouth bass in 2016, therefore no largemouth bass were stocked during 2016. Largemouth bass fingerlings have been stocked almost annually since 2000 at rates ranging from 5.0 fish/acre to 10.0 fish/acre and from 1985 to 1992 at various rates. The need for stocking and the numbers stocked in reservoirs are based (since 2004) on results of the age-0 year class strength sampled in early September and the predicted age-1 year class strength the following spring.

Trap netting effort for crappie (Table 9) resulted in the collection of 618 white crappie and 175 black crappie. Crappie were sampled with trap nets during 36 net-nights. PSD and $\mathrm{RSD}_{10}$ values are shown in Table 10. Age and growth determinations along with age frequency for black and white crappie were completed using otoliths and are shown in Tables 11-15. Age studies indicated white crappie reach 9.0 in between age 1 and age 2 while black crappie reached 9.0 in between age 2 and age 3. The crappie population assessment scores (Tables 13 and 16) rated white crappie as "Excellent" and black crappie as "Fair". Historically, the crappie population at Taylorsville Lake has been very cyclic with peaks occurring every 7 to 9 years. In an effort to help recruitment on the lake, white crappie were stocked from 2009 through 2013. Significant spawns have occurred in both 2013 and 2015, however the 2016 spawn appeared to be poor based off trap net data. Body condition of white and black crappie in the fall of 2016 were acceptable, but lower than expected for Taylorsville Lake (Table 17).

Fall gill netting for hybrid striped bass and white bass was conducted in October 2016 (Tables 18-26). A total of 167 hybrid striped bass were collected in 2016 compared to 47 in 2015, 90 in 2014, 132 in 2013, 47 in 2012, 94 in 2011 and 51 in 2010. Hybrid striped bass were captured in 8 net-nights ( 4 nets for 2 nights) for a CPUE of 15.2 ( $\pm$ 6.7) fish/nn. The hybrid striped bass population has exhibited notable fluctuations since 1990 . The density of hybrid striped bass in Taylorsville Lake appeared to be negatively correlated with the amount of tailwater discharge (due to rainfall) and fishing pressure. It is theorized that above-normal discharge leads to escapement of hybrid striped bass but has little effect on the white bass density in the lake. Additionally, a late fall water quality issue with low oxygen in the lower portion of Taylorsville Lake may be causing additional stress on the hybrid striped bass. Age and growth studies were completed for hybrid striped bass using otoliths (Tables 19 and 20). Studies indicate hybrid striped bass reached 15.0 in between one to two years. This is good growth for hybrid striped bass at Taylorsville Lake. The relative weight $\left(\mathrm{W}_{\mathrm{r}}\right)$ index for hybrid striped bass (82) continues to show below average body condition at Taylorsville Lake (Table 21). The average $\mathrm{W}_{\mathrm{r}}$ for Taylorsville Lake is 86 . The population assessment for hybrid striped bass was rated at "Good", an increase from the "Fair" rating in 2015 at Taylorsville Lake (Table 22). Annual
stocking rates for hybrid striped bass have been 20 fish/acre ( 1.4 to 2.0 in ) for the last 15 years. Taylorsville Lake was stocked with 63,750 ( 20.9 fish/acre; 1.2-1.8 in) hybrid striped bass in June 2016. The 2016 hybrid striped bass stocking in Taylorsville Lake included both crosses of hybrid striped bass ( 31,350 reciprocal cross hybrids (no OTC mark) and 32,400 original cross hybrid striped bass (OTC marked)). Data for white bass collected during fall 2016 gillnetting studies are presented in Tables 18 and 23-26. White bass comprised about $35 \%$ of the Morones sampled, compared to $27 \%$ in $2015,47 \%$ in $2014,29 \%$ in 2013 , $59 \%$ in $2012,72 \%$ in 2011, and $80 \%$ in 2010. Age and growth studies indicated white bass reach 12.0 in between age 2 and age 3 (Tables 23 and 24). Relative weight values ( $\mathrm{W}_{\mathrm{r}}=90$ ) revealed acceptable body condition for all sizes of white bass (Table 25). The white bass population assessment was rated "Poor", an average rating for white bass at Taylorsville Lake (Table 26).

Saugeye were collected during fall gill netting conducted in October. A total of 61 saugeye were collected ranging from the 9.0 - to 18.0 -in class. Age $0+$ saugeye ranged from the 9.0 - to 11.0 -in class, while age $1+$ saugeye were in the 15.0 - to 18.0 -in class (Table 18). Taylorsville Lake was stocked with 8,161 ( 2.7 fish/acre; 1.7 in ) saugeye in 2016. This was the second stocking of saugeye into Taylorsville Lake. Taylorsville Lake has only received stockings of saugeye when there is a surplus at the hatchery.

Summer diurnal low-pulse electrofishing was completed in July 2016 to assess the blue catfish population. Two sections (Lower Lake: Big Beech Creek and Ashes/Jacks Creek, and Upper Lake: Chowning Lane and Van Buren areas) of Taylorsville Lake were sampled for 3.0 hours ( 15 -minute runs). Two hundred and thirty-one blue catfish were collected in the lower section compared to 59 blue catfish collected in the upper section of the lake (Table 27). The number of blue catfish collected in 2016 ( $96.7 \mathrm{fish} / \mathrm{hr}$ ) was lower than the lake's historic average of 112.3 fish $/ \mathrm{hr}$ (Table 28). Relative weight values revealed good body condition for all sizes of blue catfish (Table 29). A subsample of fish less than 13.0 in were collected for age determination using otoliths. The presence of age-1+ fish indicated natural reproduction with those fish ranging from the 9.0 - to 12.0 -in size class. Natural reproduction has been detected since 2012. Otoliths were also removed from a $44.7 \mathrm{in}, 55.66 \mathrm{lb}$ blue catfish harvested by an angler at Taylorsville Lake. This fish was age 14, which was from the second year class stocked. In an effort to target larger blue catfish, which have been reported by anglers and considered underestimated in the summer electrofishing, winter gillnetting was utilized. In February 2017, 5 -in mesh gill nets were set in both the upper and lower sections of Taylorsville Lake in an effort to collect information on blue catfish $\geq 30.0$ in. A total of 30 blue catfish were collected in 12 net-nights (Table 30). The catch rate of $\geq 30.0$ in blue catfish was 2.3 fish $/ \mathrm{nn}$, which was lower than the catch rate of $\geq 30.0$ in blue catfish in 2016 ( 5.5 fish $/ \mathrm{nn}$ ). Relative weight values indicated blue catfish during the winter months are in excellent conditions as the overall $\mathrm{W}_{\mathrm{r}}$ was 115 (Table 31). A total of 23,500 (7.7 fish/acre) blue catfish (8.0-15.0 in) were stocked in Taylorsville Lake during August 2016.

A roving daytime angler creel survey was conducted at Taylorsville Lake from April through October. The last creel survey conducted at this lake was in 2009. Table 32 provides descriptive statistical parameters of the lake fishery. The number of fishing trips in $2016(26,303)$ increased from $2009(25,895)$. Total fishing pressure (man-hours) declined from 2009, however the number of fish caught, number of fish harvested and pounds of fish harvested all increased from the 2009 creel survey. Other parameters such as gender, residency and mode have remained about the same since 2009. However, some notable differences in angler methods include a $9.9 \%$ increase in casting and an $8.7 \%$ decrease in jugging.

Numbers of largemouth bass caught in 2016 decreased by about 3,400 fish from numbers seen in 2009 (Table 33 and 34), while the number of largemouth bass harvested in 2016 was comparable to 2009 creel survey results. Mean length of largemouth bass harvested was 15.8 inches in both the 2009 and 2016 surveys (Table 35). The number of fishing trips for black bass in 2016 was 8,322 , less than the 9,032 trips recorded in 2009. Black bass was the second most sought-after group fished for in Taylorsville Lake in 2016. Black bass had been the most sought-after group in both the 2006 and 2009 surveys. Catch rate of bass by bass anglers increased from $1.19 \mathrm{fish} / \mathrm{hr}$ in 2009, to 1.49 fish $/ \mathrm{hr}$ in 2016. Bass angler success rate was $9.7 \%$ in 2016, which improved from $8.1 \%$ in 2009. Largemouth bass continue to dominate the black bass population with only incidental catches of smallmouth bass. Black bass catch, harvest and monthly angling success are shown in Table 36.

Numbers of crappie caught increased from 16,747 fish caught in 2009 to 84,335 in 2016 (Table 33). Additionally, the number of crappie harvested increased from 15,084 fish in 2009 to 48,656 in 2016. Mean length of white and black crappie harvested was 10.4 in and 10.0 in, respectively (Table 37). Crappie were the most sought-after group fished for at Taylorsville Lake in 2016. The number of fishing trips for crappie increased from 5,479 in 2009 to

9,982 in 2016. Harvest rate by crappie anglers improved from 0.56 fish $/ \mathrm{hr}$ to 0.94 fish $/ \mathrm{hr}$. Percent success of crappie anglers increased from $55 \%$ in 2009 to $58 \%$ in 2016 . White crappie represented $80.2 \%$ of the crappie caught ( $44.5 \%$ in 2009) and $69.8 \%$ of the crappie harvested ( $47.0 \%$ in 2009). Crappie catch, harvest and monthly angling success are shown in Table 38.

The third most sought-after group was catfish with 2,817 trips by catfish anglers compared to 3,906 trips in 2006. Catfish numbers caught decreased from 25,857 fish in 2009 to 15,040 fish in 2016 (Table 33). Blue catfish contributed $52.6 \%$ of the catfish caught, compared to $47.0 \%$ in 2009. Pounds of catfish harvested increased from $27,699 \mathrm{lbs}$ in 2009 to $33,357 \mathrm{lbs}$ in 2016. Pounds of blue catfish harvested by catfish anglers increased from 679 lbs in $2003,3,178 \mathrm{lbs}$ in $2006,19,182 \mathrm{lbs}$ in 2009 , to $25,970 \mathrm{lbs}$ in 2016 . Mean length of channel catfish harvested by catfish anglers was 14.9 inches ( 13.3 in 2009), blue catfish was 20.9 inches ( 16.9 inches in 2009) and flathead catfish was 25.5 inches. Harvest rate by catfish anglers decreased from 0.82 fish/hr (2009) to 0.64 fish/hr (2016). Success rate for catfish anglers decreased from $80.0 \%$ in 2009 to $66.1 \%$ in 2016. Catfish catch, harvest and monthly angling success are shown in Tables 39 and 40. During each interview, the creel clerk recorded the total number of jugs that each angler was fishing. The majority of anglers ( $71.6 \%$ ) fished with less than 20 jugs. Twenty-one percent of anglers fished 21-30 jugs, $4.9 \%$ fished with $31-40$ jugs and $2.9 \%$ fished with $41-50$ jugs.

The Morone group (hybrid striped bass and white bass) was the least sought-after group at Taylorsville Lake in 2016 (Table 33). The number of hybrid striped bass (HSB) caught decreased from 5,667 fish (2,090 harvested) in 2009 to 1,461 (357 harvested) in 2016. White bass (WB) numbers caught significantly decreased with 17,808 caught in 2009 ( 4,982 harvested) to 904 caught in 2016 ( 737 harvested). Pounds of HSB harvested in 2016 totaled 286 lbs $(0.09 \mathrm{lbs} / \mathrm{a})$, whereas in 2009 it was $2,491 \mathrm{lbs}(0.82 \mathrm{lbs} / \mathrm{a})$. Pounds of WB harvested in 2016 totaled $327 \mathrm{lbs}(0.11$ $\mathrm{lbs} / \mathrm{a}$ ) while in 2009 it was $1,960 \mathrm{lbs}(0.64 \mathrm{lbs} / \mathrm{a})$. Mean length of HSB harvested in 2016 was 12.2 in while in 2009 it was 13.4 in. Mean length of WB harvested in 2016 was 8.5 in , with 9.1 in being the average in 2009. The number of trips for Morones decreased from 1,532 trips in 2009 to 476 trips in 2016. Hours spent fishing for these fish also decreased from $7,881 \mathrm{hrs}(2.58 \mathrm{hrs} / \mathrm{a})$ in 2009 to $2,144 \mathrm{hrs}(0.70 \mathrm{hrs} / \mathrm{a})$ during 2016. Harvest rate for Morone anglers remain consistent from 2009 ( 0.65 fish $/ \mathrm{hr}$ ) to 2016 ( $0.63 \mathrm{fish} / \mathrm{hr}$ ). Success rate for these anglers decreased from $47 \%$ in 2009 to $31 \%$ in 2016. Morone catch, harvest and monthly angling success are shown in Tables 41 and 42.

Panfish, primarily bluegill, was the fourth sought-after group with a total of 31,707 fish caught during the 2016 season. Pounds harvested in 2016 was less than that seen in 2009 - going from 3,171 lbs ( $1.04 \mathrm{lbs} / \mathrm{a}$ ) in 2009 to $2,415 \mathrm{lbs}(0.79 \mathrm{lbs} / \mathrm{a})$ in 2016. The average length of bluegill harvested was 5.8 in , comparable to the average size ( 5.6 in) caught in 2009. Trips for panfish decreased from 1,510 trips in 2009 to 1,106 trips in 2016. The harvest rate for panfish in 2016 ( $2.4 \mathrm{fish} / \mathrm{hr}$ ) was comparable to $2.6 \mathrm{fish} / \mathrm{hr}$ recorded in 2009. The percentage of successful panfish anglers was $88 \%$ while in 2009 it was $78 \%$. Length distribution and numbers of species caught and harvested are shown in Table 34.

An angler attitude survey was conducted at Taylorsville Lake during the creel survey. Surveys were completed in the field by the creel clerk. A total of 212 surveys were completed in 2016 (278 surveys in 2009). The attitude survey reflected that $34.4 \%$ of all anglers fish for bass, which increased from $26.3 \%$ in 2009 . Anglers fishing for crappie had the greatest increase with $84.0 \%$ of all anglers fishing for crappie in 2016 ( $57.6 \%$ in 2009). Anglers fishing for white bass, hybrid striped bass, channel catfish and blue catfish also increased from the results collected in 2009. The only decrease in 2016 from results in 2009 was in anglers seeking bluegill. Bass anglers ( $86.6 \%$ ) and crappie anglers ( $94.8 \%$ ) in 2016 expressed high levels of satisfaction, which increased from the 2009 survey. Sixtytwo percent of crappie anglers were not satisfied with the current size limit. Of the crappie anglers dissatisfied, $85.3 \%$ stated they would prefer at 10.0 -in size limit. White bass ( $100.0 \%$ ), hybrid striped bass ( $100.0 \%$ ) and channel catfish $(76.6 \%)$ anglers were satisfied with the current size and creel limits for those species. Sixty percent of blue catfish anglers are not satisfied with the current size and creel limits with $44.2 \%$ of those anglers wanting a 30.0 in size limit. Eighty-nine percent of anglers reported that jug fishing had not affected on their fishing experience at Taylorsville Lake.

## Herrington Lake (2,410 acres)

Diurnal electrofishing studies were completed in March 2016 to monitor the crappie population. Upper, middle, and lower lake sections were sampled for a total of 4.5 hours. A total of 204 crappie were collected, compared to 117 in 2014, 380 in 2012, 409 in 2011, 225 in 2010, 99 in 2009, 108 in 2008, 81 in 2007, and 84 in 2006 (Table 43). The PSD for both white (100) and black (99) crappie were similar to the lake's historical averages of 96 and 97 , respectively (Table 44). The overall catch was dominated by black crappie, which made up $76.0 \%$ of the crappie sampled at Herrington Lake in 2016. A population assessment was developed for spring electrofishing of white and black crappie at Herrington Lake. The population assessment for white crappie indicated a "Poor" population for 2016, below the lake's average of "Fair" (Table 45). The population assessment for black crappie indicated a "Good" population for 2016 (Table 46), an above average rating.

Spring diurnal electrofishing studies were completed in April 2016 to monitor the black bass population. Upper, middle, and lower sections were sampled for a total of 7.5 hours ( 2.5 hours per section). Species composition, relative abundance, and CPUE of black bass collected in the spring are presented in Table 47. Largemouth bass dominated the black bass fishery, with spotted bass comprising $7.3 \%$ of the bass sampled. No smallmouth bass were collected in 2016. Numbers of largemouth bass collected in 2016 (110.0 fish/hr) was comparable to the lake's historic average of 113.8 fish $/ \mathrm{hr}$ (Table 48). Fluctuations in the overall catch rates over the past couple of years seem to be related to lake level during sampling. The higher the lake level the lower the catch rate of bass at Herrington Lake. The lake level during the 2016 spring electrofishing sample was low, which may have led to a slight increase in the catch rate for largemouth bass. Catch rate for keeper bass ( $\geq 12.0 \mathrm{in}$ ) was $34.1 \mathrm{fish} / \mathrm{hr}$, less than the lake's historical average ( $44.9 \mathrm{fish} / \mathrm{hr}$ ). Overall, black bass catch rates were comparable in all three sections. The PSD for largemouth bass was 44, which was much lower than the lake's average of 56 (Table 49).
Additionally, the $\mathrm{RSD}_{15}$ value was 23 , which was similar to the lake average of 24 . The largemouth bass population assessment score, based on spring electrofishing data, was 16 ("Good"), which is an average rating for Herrington Lake (Table 50).

Length frequency, relative weights and index of year class strength at age-0 and age- 1 of largemouth bass based on September electrofishing at Herrington Lake are presented in Tables 51-53. Largemouth bass condition in 2016 ( $\mathrm{W}_{\mathrm{r}}$ $=92)$ was equal to the lake's historical average $\left(\mathrm{W}_{\mathrm{r}}=92\right)($ Table 52). The year class strength model for Herrington Lake indicated an above average recruitment year for young-of-year largemouth bass in 2016 based on age-1 CPUE (Table 53). Age-0 CPUE ( $24.9 \mathrm{fish} / \mathrm{hr}$ ) was less than the lake average ( $37.0 \mathrm{fish} / \mathrm{hr}$ ). Herrington Lake was stocked with 29,361 (12.2 fish/acre) largemouth bass (4.2-4.8 in) in 2016.

Gill netting for hybrid striped bass and white bass was completed in October 2016. During the 20 net-night sampling period, 104 hybrid striped bass and 114 white bass were collected (Table 54). Otoliths were taken from both species for age and growth determinations. Results of these studies indicated excellent growth rates for both hybrids (Tables 55-56) and white bass (Tables 59-60). Hybrid striped bass continue to reach 15.0 in between age 1 and 2 (Table 55), as they have historically. Of the hybrid striped bass sampled, $83 \%$ were age- $1+$ or older (Table 56). Condition of hybrid striped bass in $2016\left(\mathrm{~W}_{\mathrm{r}}=89\right)$ was lower than the lake's historical average $\left(\mathrm{W}_{\mathrm{r}}=93\right)$ (Table 57). The population assessment for hybrid striped bass indicated a "Fair" population (Table 58). White bass age and growth determinations showed they reached 12.0 in between age 1 and age 2 (Table 59). Of the white bass sampled, $91 \%$ were age- $1+$ and older (Table 60). The white bass population assessment indicated a "Fair" population, which is an average rating (Table 61). Body condition of white bass in 2016 ( $\mathrm{W}_{\mathrm{r}}=87$ ) was lower than the lake's historical average ( $\mathrm{W}_{\mathrm{r}}=97$ ) (Table 62). Herrington Lake was stocked with 53,748 (22.3 fish/acre; 1.2-1.8 in) hybrid striped bass in June 2016. The hybrid striped bass stocking was divided into 26,349 reciprocal cross hybrids (no mark) and 27,399 original cross hybrids (OTC marked).

## Guist Creek Lake (317 acres)

Fall largemouth bass sampling was conducted for length frequency, relative weights and index of year class strength at age-0 (Tables 63-65). Relative weights indicated good body condition for bass, especially for bass over 15.0 in (Table 64). Mean length of age-0 largemouth bass ( 5.0 in ) was larger than the lake average of 4.2 in and the catch rate of age-0 largemouth bass ( $56.0 \mathrm{fish} / \mathrm{hr}$ ) was higher than the average recruitment (avg. $=45.6 \mathrm{fish} / \mathrm{hr}$; Table 65). Therefore, largemouth bass were not stocked into Guist Creek Lake in 2016.

Guist Creek Lake was stocked with 26,570 (83.8 fish/acre; 1.8 in ) saugeye in 2016. This was the fourth year of stocking saugeye into Guist Creek Lake. The lake was sampled for saugeye during November 2016 with a boat mounted electrofishing unit for a total of 1.5 hours (Table 66). Sampling yielded 62 saugeye ( $41.3 \mathrm{fish} / \mathrm{hr}$ ) ranging in size from the 7.0 - to 21.0 -in size classes.

Channel catfish were sampled in November using three sets of three tandem hoop nets at Guist Creek Lake in 2016. Length frequency results for channel catfish showed a size distribution between the 7.0 in and 25.0 in size classes (Table 67). The PSD and $\mathrm{RSD}_{24}$ for channel catfish were 60 and 2, respectively (Table 68). Relative weights indicated slightly below average condition $\left(\mathrm{W}_{\mathrm{r}}=93\right)$ for channel catfish (Table 69). Overall catch rates (66.0 fish/set) were lower than the lake average of 127.0 fish/set (Table 70). Guist Creek Lake was not stocked with channel catfish in 2016.

Guist Creek Lake was stocked with 19,761 (62.3 fish/acre; 1.1 in) hybrid striped bass in June 2016.

## A.J. Jolly Lake (175 acres)

Spring diurnal electrofishing was completed in April 2016 to assess the black bass population (Table 71). Results indicated largemouth bass catch rates ( 94.8 fish $/ \mathrm{hr}$ ) were greater than the lake's historical average ( 83.2 fish $/ \mathrm{hr}$ ) (Table 72). The PSD for largemouth bass was 61 and the RSD $_{15}$ was 35 (Table 73). The population assessment indicated a "Good" bass population, the average rating since 2010 (Table 74). Fall diurnal electrofishing was conducted for relative weights and to index year class strength of age-0 largemouth bass in October (Tables 75-77). Relative weights indicated acceptable body condition $\left(\mathrm{W}_{\mathrm{r}}=89\right)$ (Table 76). Fall sampling indicated an above average number of age-0 bass, ( $44.0 \mathrm{fish} / \mathrm{hr}$; average $=23.0 \mathrm{fish} / \mathrm{hr}$ ) and above average size of age- 0 bass in 2016 $(5.1 \mathrm{in}$; average=4.5 in) (Table 77). Largemouth bass were not stocked during 2016.
A.J. Jolly Lake was stocked with 14,000 ( 80.0 fish/acre; 1.8 in ) saugeye in 2016. This was the fourth year of saugeye stocking into A.J. Jolly Lake. Saugeye were collected during the spring largemouth bass sample (Table 71). Sampling yielded 81 saugeye ( 32.4 fish $/ \mathrm{hr}$ ) ranging in size from the 6.0 - to 19.0 - in size class. Additionally, saugeye were collected during the fall largemouth bass sample (Table 75). Sampling yielded 42 saugeye ( $21.0 \mathrm{fish} / \mathrm{hr}$ ) ranging in size from the 5.0 - to 22.0 -in size class.
A.J. Jolly Lake was stocked with 1,750 (10.0 fish/acre; 4.0 - 9.0 in) blue catfish in April 2016.

A creel survey conducted during 2016 by the AJ Jolly Nature Resource Committee resulted in only 10 completed creel cards. From this very small sample size, the average trip length was 4.5 hrs with $60 \%$ of anglers fishing from a boat and $40 \%$ of anglers' bank fishing. The most sought after species was catfish ( $30 \%$ ) followed by both saugeye or anything at $20 \%$ each.

An angler attitude survey was conducted at AJ Jolly Lake through both an online survey and an onsite survey conducted by the AJ Jolly Nature Resource Committee in conjunction with the Campbell County Fiscal Court during 2016. A total of 75 surveys were completed. The survey reflected that $56.1 \%$ of all anglers were satisfied the fishing at AJ Jolly compared to the $16.5 \%$ of anglers that were dissatisfied. Overall, $97.1 \%$ of anglers were satisfied with the current size and creel limits. The majority of anglers (63.4\%) stated that they would prefer AJ Jolly to be managed for a balanced bass and bluegill fishery. Sixty-eight percent of anglers are satisfied with the current facilities at AJ Jolly compared to $4.3 \%$ of anglers that were dissatisfied.

## Beaver Lake (158 acres)

A spring diurnal electrofishing sample was completed in April 2016 to assess the black bass population (Table 78). The CPUE for all sizes was $263.5 \mathrm{fish} / \mathrm{hr}$, greater than the lake average of $240.7 \mathrm{fish} / \mathrm{hr}$ (Table 79). Largemouth bass sampling continues to show the bass removal conducted in the spring of 2011 was beneficial for sustaining increases to the catch rates of $\geq 15.0$ in bass and $\geq 20.0$ in bass. The PSD and RSD 15 for largemouth bass respectively, were 34 and 9 , compared to the current lake average of 29 and 4 (Table 80). The population assessment score indicated an "Excellent" bass population (Table 81), which is the best assessment rating for Beaver Lake largemouth bass since 2001. Fall diurnal electrofishing was conducted for relative weights and the index of age-0 year class strength (Tables $82-84$ ). The relative weight index continues to reflect below expected average weights
for most length groups of largemouth bass at Beaver Lake in $2016\left(\mathrm{~W}_{\mathrm{r}}=82\right)$; which is lower than the lake average of 85 (Table 83). Fall sampling indicated above average numbers of age-0 bass, ( $370.0 \mathrm{fish} / \mathrm{hr}$; average $=125.0$ fish $/ \mathrm{hr}$ ) and the average size of largemouth bass ( 5.6 in ) in the fall of 2016 at Beaver Lake was higher than the lake's average of 4.2 in (Table 84).

A spring diurnal electrofishing sample was completed in May 2016 to assess the panfish populations (Tables 85-91). Length frequency results showed the majority of bluegill were in the 4.0 - to 7.0 -in range (Table 85). The PSD for bluegill was 49 compared to the lake average of 29 (Table 86). The $\mathrm{RSD}_{8}$ was 1 , which is the lake average. CPUE for all length groups of bluegill was $450.4 \mathrm{fish} / \mathrm{hr}$; considerable higher than the lake average of $244.4 \mathrm{fish} / \mathrm{hr}$ (Table 87). Redear sunfish PSD and $\mathrm{RSD}_{9}$ were 38 and 8 , respectively (Table 86). The population assessment for bluegill indicated a "Good" population rating, which is average for Beaver Lake (Table 88). The catch rate of redear sunfish $\geq 8.0$ in was $2.4 \mathrm{fish} / \mathrm{hr}$ and was significantly lower than the lake average of $24.2 \mathrm{fish} / \mathrm{hr}$ (Table 89). Additionally, catch rates for all sizes were significantly lower than the lake's average catch rates for all sizes. The population assessment indicated a "Fair" redear sunfish fishery (Table 90). Relative weights for bluegill and redear sunfish were collected during the fall diurnal electrofishing sample. Overall, relative weight data for redear sunfish was good while body condition of bluegill was fair (Table 91). A total of 31,600 (200.0 fish/acre; 1.0-2.0 in) redear sunfish were stocked during September 2016.

Beaver Lake was stocked with 3,703 (23.4 fish/acre; 6.0 - 10.0 in) channel catfish in July 2016.
No applications of aquatic herbicides were completed at Beaver Lake in 2016. No liquid fertilizer applications have been made since 2001. Finally, one 18.0-in class gizzard shad was collected at Beaver Lake in 2016.

## Benjy Kinman Lake (88 acres)

A spring nocturnal electrofishing sample was completed in April 2016 with an additional diurnal sample completed in May 2016 to assess the black bass population (Table 92). The CPUE for all sizes was $132.6 \mathrm{fish} / \mathrm{hr}$, compared to 126.6 fish/hr collected in 2015 (Table 93). The PSD and RSD $_{15}$ for largemouth bass respectively, were 21 and 7 (Table 94). The population assessment score indicated a "Fair" bass population (Table 95). Fall largemouth bass sampling was conducted for relative weights, age and growth, and index of year class strength at age- 0 and age- 1 in September 2016 (Tables 96-98). Relative weights indicated below average body condition for bass $\left(\mathrm{W}_{\mathrm{r}}=82\right)$ with larger fish exhibiting better condition compared to smaller length groups (Table 97). The better condition of larger fish is due to the gizzard shad forage base. CPUE for both age-0 and age- $0 \geq 5.0$ in were collected for the third time at Benjy Kinman Lake (Table 98).

A spring diurnal electrofishing sample was completed for the first time at Benjy Kinman Lake in May 2016 to assess the panfish populations (Tables 99-102). Length frequency results showed the majority of bluegill were in the 3.0to 4.0 -in range with fish collected up to the 8.0 -in size class (Table 99). The PSD and $\mathrm{RSD}_{8}$ for bluegill was 27 and 1 , respectively (Table 100). Length frequency results showed the majority of the redear sunfish were in the 3.0 in and 7.0- to 8.0 -in size range (Table 99). Redear sunfish PSD and RSD 9 was 63 and 0 , respectively (Table 100). Relative weights for bluegill and redear sunfish were collected during the fall diurnal electrofishing sample. Overall, the body condition for both bluegill (94) and redear sunfish (92) was good (Table 103).

A total of ten removal events took place from July 2016- March 2017 resulting in a total of 1,633 bigmouth buffalo, smallmouth buffalo, common carp, river carpsucker, and longnose gar were removed from Benjy Kinman Lake. The average weight of removed rough fish was 7.1 lbs . Therefore, it was estimated that $11,643 \mathrm{lbs}$ of rough fish were removed from Benjy Kinman Lake in 2016/2017. The three-year total for rough fish removed from Benjy Kinman Lake is 2,468 fish at an estimated weight of $16,556 \mathrm{lbs}$ ( 6.7 lbs average weight per fish).

## Boltz Lake (92 acres)

Fall diurnal electrofishing was conducted for length frequency, relative weights and index of age-0 year class strength in September (Tables 104-106). Overall, the relative weight was 89 , comparable to the lake's average relative weight of 90 (Table 105). Fall sampling indicated about average numbers of age- 0 bass, ( $69.3 \mathrm{fish} / \mathrm{hr}$; average $=52.8 \mathrm{fish} / \mathrm{hr}$ ) and the average size ( 4.1 in ) was comparable to the lake's average size of 4.2 in (Table 106). Largemouth bass were not stocked in Boltz Lake during 2016.

Spring diurnal electrofishing for bluegill was conducted in May 2016 (Table 107). The overall catch rate for bluegill was higher in 2016 ( 508.8 fish $/ \mathrm{hr}$ ) than the lake average ( 498.6 fish $/ \mathrm{hr}$; Table 108). The PSD for bluegill was 18 compared to the lake average of 24 (Table 109). The $\mathrm{RSD}_{8}$ was 0 compared to the lake average of 1 . The population assessment for bluegill indicated a "Good" population, which has been the rating since 2010 (Table 110). Age and growth studies on bluegill showed that bluegill reached 6.0 in between age 3 and 4 (Table 111). The relative weight index reflected below-average condition for bluegill $\left(\mathrm{W}_{\mathrm{r}}=88\right)$ at Boltz Lake in 2016 (average $\mathrm{W}_{\mathrm{r}}=$ 90) (Table 112).

Redear sunfish (18,400 fish; 200.0 fish/acre) were stocked in September 2016 that averaged 1.0-2.0 in.
Channel catfish were sampled in October using tandem hoop nets at Boltz Lake in 2016. Length frequency results for channel catfish showed a size distribution between the 12.0 and 20.0 in size classes (Table 113). The PSD and $\mathrm{RSD}_{24}$ for channel catfish was 12 and 0 , respectively (Table 114). Relative weights indicated fair body condition for channel catfish $\left(\mathrm{W}_{\mathrm{r}}=85\right)$, which was lower than the average for the lake $\left(\mathrm{W}_{\mathrm{r}}=92\right)$ (Table 115). Overall, catch rates at Boltz Lake remain lower than the lake average of 59.9 fish $/ \mathrm{hr}$ (Table 116). Channel catfish were not stocked during 2016. Boltz Lake was stocked with 920 ( 10.0 fish/acre; $4.0-9.0$ in) blue catfish in 2016. Blue catfish were not sampled at Boltz Lake in 2016.

Saugeye were stocked into Boltz Lake for the second time during 2016. A total of 7,200 saugeye ( 78.3 fish/acre) were stocked at an average size of 1.8 in .

Currently, Boltz Lake does not have a population of gizzard shad.

## Corinth Lake (96 acres)

Fall diurnal electrofishing for largemouth bass was conducted to determine length frequency, year class strength and relative weight (Tables 117-119). Relative weights of largemouth bass continue to be below average, except for largemouth bass $\geq 15.0 \mathrm{in}$. The overall relative weight in $2016\left(\mathrm{~W}_{\mathrm{r}}=80\right)$ was less than the average relative weight observed at Corinth Lake ( $\mathrm{W}_{\mathrm{r}}=84$; Table 118). The year class strength model indicated that 2016 was a below average recruitment year for young-of-year largemouth bass (Table 119). Age-0 CPUE ( $30.0 \mathrm{fish} / \mathrm{hr}$ ) in 2016 remained below the lake average ( 90.9 fish/hr); however, largemouth bass were not stocked into Corinth Lake in 2016.

Spring diurnal electrofishing for bluegill and redear sunfish was completed in May 2016 to obtain length frequency, CPUE and population assessment data (Table 120). Bluegill PSD (70) was significantly higher than the lake average of 30 (Table 121). Bluegill catch rates ( $204.8 \mathrm{fish} / \mathrm{hr}$ ) in 2016 were less than the lake average ( $238.5 \mathrm{fish} / \mathrm{hr}$; Table 122). The population assessment indicated a "Good" population, the average rating for the past ten years (Table 123). The redear sunfish catch rate ( 135.2 fish $/ \mathrm{hr}$ ) continued to increase in 2016 and was higher than the lake's average ( 67.4 fish/hr; Table 120). Redear sunfish PSD was 80 , higher than the lake average of 56 (Table 121) Catch rate for redear sunfish $\geq 8.0$ in was $33.6 \mathrm{fish} / \mathrm{hr}$ in 2016 remaining higher than the lake average of $27.9 \mathrm{fish} / \mathrm{hr}$ (Table 124). The population assessment for redear sunfish continued to be rated as "Good" (Table 125). Relative weights and age/growth data was collected for bluegill and redear sunfish during the fall diurnal electrofishing survey. Growth data indicated that bluegill reach 6.0 in at age $2+$ (Table 126). Redear sunfish reach 8.0 in at age 4+ (Table 127). Relative weights indicated fair condition for bluegill (88) and good condition for redear sunfish (91; Table 128).

Corinth Lake was stocked with 100 (1.0 fish/acre; 8.0-12.0 in) grass carp during 2016.

## Elmer Davis Lake (149 acres)

Spring diurnal electrofishing studies were conducted in April 2016 for PSD, length frequency and CPUE for largemouth bass (Table 129). The total catch rate in 2016 ( 341.0 fish $/ \mathrm{hr}$ ) was higher than the historical lake average of 307.8 fish $/ \mathrm{hr}$ (Table 130). Largemouth bass PSD and RSD $_{15}$ were 60 (average $=28$ ) and 16 (average $=8$ ), respectively in 2016 (Table 131). The population assessment indicated an "Excellent" bass population, better than the ten-year average rating of "Good" at Elmer Davis Lake (Table 132). Fall electrofishing evaluated largemouth
bass relative weight, age and growth and index of year class strength (Tables 133-136). Largemouth bass relative weight in $2016\left(\mathrm{~W}_{\mathrm{r}}=84\right)$ was less than the historical lake average ( $\mathrm{W}_{\mathrm{r}}=87$; Table 134). Age and growth studies show that largemouth bass reach 12.0 in at age $3+$ and 15.0 in at age 7 (Table 135). The year class strength model for Elmer Davis Lake indicated that 2016 was a below average recruitment year for young-of-year largemouth bass. Age-0 CPUE ( $80.0 \mathrm{fish} / \mathrm{hr}$ ) in 2016 remained below the lake average ( $123.3 \mathrm{fish} / \mathrm{hr}$ ) (Table 136). No largemouth bass were stocked due to a gizzard shad removal project that was completed in December 2016.

The relative weight index reflects average condition for both for bluegill $\left(\mathrm{W}_{\mathrm{r}}=95\right)$ and redear sunfish $\left(\mathrm{W}_{\mathrm{r}}=96\right)$ at Elmer Davis Lake in 2016; however both species are below the lake averages of 96 and 102, respectively (Table 137).

Channel catfish were sampled in October using tandem hoop nets at Elmer Davis Lake. Channel catfish collected ranged from the 13.0 - to 23.0 -in size classes (Table 138). Channel catfish were collected at $12.0 \mathrm{fish} / \mathrm{set}$ in 2016, which is lower than the lake average of 77.8 fish/set (Table 139). The PSD and $\mathrm{RSD}_{24}$ for channel catfish were 52 and 0, respectively (Table 140). Relative weights of channel catfish was 96 (Table 141). Elmer Davis Lake was not stocked with channel catfish in 2016.

The presence of gizzard shad at Elmer Davis are negatively impacting the management of panfish. Therefore, a low concentration ( 0.2 ppm ) of rotenone was applied on December 13, 2016 to selectively eradicate gizzard shad. Prior to the rotenone application the valve on the dam was opened (October 10, 2016) releasing water until December 12, 2016; lowering the lake 11.75 feet at a rate of 1.0-4.0 in per day. Initially, the gizzard shad eradication appears to be successful, however additional sampling will be required during 2017 to completely evaluate the success of the treatment. A minimal number of non-target species were observed dead after the eradication which included largemouth bass, bluegill, redear sunfish, white and black crappie, warmouth, channel catfish and yellow bullhead.

During the drawdown, a leak located below the dam was monitored in an effort to identify the elevation ( 10.5 ft below full pool) at which to leak was occurring. The source of this leak was discovered in the shelf rock located in the cove adjacent to the ramp. Therefore, the lake elevation was maintained at a level lower than the leak so that the Engineering Division could address this issue.

## Kincaid Lake (183 acres)

No spring electrofishing was conducted on Kincaid Lake in 2016 to assess the black bass population. Diurnal fall electrofishing for relative weights and index of year class strength at age 0 was conducted in October 2016 (Tables 142-144). Relative weights of largemouth bass length groups was average for Kincaid Lake in 2016 (2016 $\mathrm{W}_{\mathrm{r}}=92$; lake average $=92$ ) $($ Table 143). Age-0 CPUE ( $34.0 \mathrm{fish} / \mathrm{hr}$ ) was below the lake average ( $37.8 \mathrm{fish} / \mathrm{hr}$ ) (Table 144); however, largemouth bass were not stocked into Kincaid Lake in 2016. Kincaid Lake has hosted a population of gizzard shad for decades.

## McNeely Lake (51 acres)

Spring diurnal electrofishing studies were conducted in May 2016 for PSD, length frequency and CPUE for largemouth bass (Table 145). Total catch rate in 2016 ( $229.0 \mathrm{fish} / \mathrm{hr}$ ) was higher than the lake average of 223.2 fish/hr (Table 146). Largemouth bass PSD and $\mathrm{RSD}_{15}$ was 29 (average $=34$ ) and 5 (average $=10$ ), respectively in 2016 (Table 147). The population assessment indicated a "Fair" bass population, compared to the lake average of "Good" (Table 148). Diurnal fall electrofishing for largemouth bass in October 2016 was completed to collect length frequency, relative weight values, age and growth and to index the year class strength at age- 0 (Table 149). Growth rates indicate most bass are reaching harvestable size ( 12.0 in ) at age 4 (Table 150). Relative weights were at acceptable levels in $2016\left(\mathrm{~W}_{\mathrm{r}}=89\right)$, equal to the lake average ( $\mathrm{W}_{\mathrm{r}}=89$; Table 151). CPUE for age-0 bass (96.0 fish $/ \mathrm{hr}$ ) is lower than the lake average of 119.8 fish $/ \mathrm{hr}$ (Table 152). Largemouth bass were not stocked into McNeely Lake in 2016. Currently, McNeely Lake does not contain a population of gizzard shad.

Bluegill and redear sunfish were collected in October 2016 for relative weight values. Good body condition was observed for both bluegill (95) and redear sunfish (95) during the fall of 2016 (Table 153).

Channel catfish were not sampled at McNeely Lake in 2016. McNeely Lake was stocked with 1,275 (25.0 fish/acre; $6.0-10.0 \mathrm{in}$ ) channel catfish in July 2016.

## Charlie Vettiner Golf Course Lake

Length frequency, relative abundance and CPUE of fish collected by electrofishing at the Charlie Vettiner Golf Course Lake (Jefferson Co.) in April 2016 are shown in Table 154. Largemouth bass were collected from the 9.0- to 19.0 -in size classes and bluegill from the 2.0 - to 6.0 -in size classes. Other species collected include redear sunfish, hybrid sunfish, white crappie and channel catfish. Bathometry of the lake was also completed in 2016.

## Flagship Park Lake

Length frequency, relative abundance and CPUE of fish collected by electrofishing at Flagship Park Lake (Kenton Co.) in April 2016 are shown in Table 155. Largemouth bass were collected from the 9.0- to 20.0-in size classes and bluegill from the 3.0 - to 9.0 -in size classes. Other species collected included white crappie and channel catfish.

## Iroquois Park Lake

Length frequency, relative abundance and CPUE of fish collected by electrofishing at Iroquois Park Lake (Jefferson Co.) in April 2016 are shown in Table 156. Bluegill and blue catfish were the only two species collected, with most of the bluegill collected being less than 5.0 in.

## Jericho Lake

Length frequency, relative abundance, and CPUE of fish collected by electrofishing at Jericho Lake in May 2016 are shown in Table 157. Samples show largemouth bass from 3.0- to 20.0 -inches in good numbers.

## Leary Lake

Length frequency, relative abundance and CPUE of fish collected by electrofishing at Leary Lake (Grant Co.) in April 2016 are shown in Table 158. Largemouth bass were collected from the 3.0- to 21.0-in size classes and bluegill from the 2.0 - to 7.0 -in size classes. Low numbers of both white crappie and channel catfish were also collected.

## Logan Hubble Lake

Length frequency, relative abundance, and CPUE of fish collected by electrofishing at Logan Hubble Lake (Garrard Co.) in June 2016 are shown in Table 159. Studies show good numbers of largemouth bass from the 3.0- to 18.0-in size class. Bluegill up to 7.0 in were collected as well as redear sunfish up to 10.0 in . Bathometry of the lake was also completed in 2016.

## Lower Thomas Lake

Length frequency, relative abundance, and CPUE of fish collected by electrofishing at Lower Thomas Lake (Owen Co.) in May 2016 are shown in Table 160. Studies show good numbers of largemouth bass from the 3.0- to 15.0 -in size class. Bluegill up to the 8.0 -in size class were collected as well as redear sunfish up to the $10.0-\mathrm{in}$ size class. No shad were observed during 2016 following the shad removal completed in December 2014.

## Mitchell Hill Lake

Length frequency, relative abundance and CPUE of fish collected by electrofishing at Mitchell Hill Lake (Jefferson Co.) in April 2016 are shown in Table 161. Largemouth bass were collected from the 4.0- to 23.0-in size classes, with low numbers of bluegill present up to the 8.0 -in size class. Bathometry of the lake was also completed in 2016.

## Moremans Hill Lake

Length frequency, relative abundance, and CPUE of fish collected by electrofishing at Moremans Hill Lake (Jefferson Co.) in April 2016 are shown in Table 162. Largemouth bass from the 4.0- to 19.0-in size class and bluegill up to the 7.0-in size class were collected. Other species collected in low number included warmouth and white crappie. Bathometry of the lake was also completed in 2016.

## Thurman Hutchins Lake

Length frequency, relative abundance, and CPUE of fish collected by electrofishing at Thurman Hutchins Lake (Jefferson Co.) in April 2016 are shown in Table 163. Largemouth bass were collected from the 3.0- to 18.0-in size class. Majority of the bluegill collected were in the 3.0 - to 4.0 -in size class with redear sunfish collected up to the 8.0 -in size class. Other species collected included warmouth, hybrid bluegill and black crappie.

## Veterans WMA Pond

Length frequency, relative abundance, and CPUE of fish collected by electrofishing at Veterans WMA Pond (Scott Co.) in June 2016 are shown in Table 164. Largemouth bass were collected from the 3.0- to 20.0 -in size class. Bluegill collected were collected up to the 8.0 -in size class with good numbers greater than 6.0 in . No other species were collected.

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body | Species | Date | $\underset{(24 \mathrm{hr})}{\text { Time }}$ | Gear | Weather | Water temp. F | Water level | Secchi (in) | Conditions | Pertinent sampling comments |

## TAYLORSVILLE LAKE ANGLER ATTITUDE SURVEY 2016

(Based on 212 surveys)
19. Have you been surveyed this year? Yes - stop survey No - continue
20. Name $\qquad$ and Zip Code
21. On average, how many times do you fish Taylorsville Lake in a year? ( $n=200$ )

First time 6.5\% 1 to $4 \mathbf{3 6 . 5 \%} \quad 5$ to $10 \mathbf{2 8 . 0 \%} \quad$ More than $10 \mathbf{2 9 . 0 \%}$
22. Which species of fish do you fish for at Taylorsville Lake (check all that apply)?

Bass 34.4\% Crappie 84.0\% Hybrid striped bass 19.3\% White Bass 19.3\% Channel Catfish 32.1\%
Blue Catfish 38.2\% Bluegill 7.1\%
23. Which one species do you fish for most at Taylorsville Lake (check only one)? ( $n=148$ )

Bass $\mathbf{1 9 . 8 \%}$ Crappie 58.8\% Hybrid striped bass 2.0\% Channel Catfish 3.4\% Blue Catfish 14.9\% Bluegill 1.4\%

## -Answer the following questions for each species you fish for - (see question 4) <br> Bass Anglers

24. In general, what level of satisfaction or dissatisfaction do you have with bass fishing at Taylorsville Lake? ( $\mathrm{n}=75$ ) Very satisfied 29.3\% Somewhat satisfied 57.3\% Neutral 10.7\% Somewhat dissatisfied 2.7\% Very dissatisfied 0.0\%

6a. If you responded with very or somewhat satisfied in question (6) - What is the single most important reason for your Satisfaction? ( $\mathrm{n}=63$ )
Number of fish 60.3\% Size of fish $\mathbf{2 5 . 4} \%$ Size Limit 6.3\% Creel Limit 6.3\% Too much cover $\mathbf{1 . 6 \%}$

6b. If you responded with somewhat or very dissatisfied in question (6) - What is the single most important reason for your Dissatisfaction? $(n=3)$
Size of fish 66.7\% Too many anglers 33.3\%
25. Are you satisfied with the current size limits ( 15 in ) and creel limits ( 6 fish) on bass at Taylorsville Lake? ( $\mathrm{n}=61$ ) Yes $93.4 \% \quad$ No 6.6\%

7a. If not, what would you prefer? $(\mathrm{n}=2) \quad$ Should be raised or slot limit $50 \%$ Statewide size limit $50 \%$
26. Do you fish in any bass tournaments on Taylorsville Lake? $(n=44) \quad$ Yes 31.8\% No 68.2\%

## Crappie Anglers

27. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Taylorsville Lake? $(\mathrm{n}=175)$ Very satisfied 61.7\% Somewhat satisfied 33.1\% Neutral 4.0\% Somewhat dissatisfied 1.1\% Very dissatisfied 0.0\%

9a. If you responded with very or somewhat satisfied in question (9) - What is the single most important reason for your Satisfaction? $(\mathrm{n}=164)$
Number of fish 71.9\% Size of fish 20.7\% Size Limit 4.3\% Creel Limit 3.0\%

9b. If you responded with somewhat or very dissatisfied in question (9) - What is the single most important reason for your Dissatisfaction? ( $n=3$ )
Number of fish 33.3\% Size of fish 33.3\% Too many anglers 33.3\%
28. Are you satisfied with the current size limits ( 9 in ) and creel limits ( 15 fish ) on crappie at Taylorsville Lake? ( $\mathrm{n}=149$ ) Yes 38.3\% No 61.7\%

10 a . If not, what would you prefer? $(\mathrm{n}=95)$
10 in size limit $\mathbf{8 5 . 3} \% 10$ in size limit, 30 fish creel $\mathbf{2 . 1} \% \quad 10$ in size limit, 20 fish creel $\mathbf{3 . 2} \% \quad 11$ in size limit $5.3 \%$ 11 in size limit, 20 fish creel $1.1 \% \quad 12$ in size limit, 30 fish creel $1.1 \% \quad 30$ fish creel limit $\mathbf{1 . 1} \% \quad$ No size limit $\mathbf{1 . 1} \%$

White Bass Anglers
29. In general, what level of satisfaction or dissatisfaction do you have with white bass fishing at Taylorsville Lake? ( $n=43$ )

Very satisfied 18.6\% Somewhat satisfied 20.9\% Neutral 11.6\% Somewhat dissatisfied 41.9\%
Very dissatisfied 7.0\%
11a. If you responded with very or somewhat satisfied in question (11) - What is the single most important reason for your Satisfaction? ( $\mathrm{n}=16$ )
Number of fish 56.3\% Size of fish 25.0\% Size Limit 6.3\% Creel Limit 12.5\%
11b. If you responded with somewhat or very dissatisfied in question (11) - What is the single most important reason for your Dissatisfaction? ( $\mathrm{n}=20$ )
Number of fish 95.0\% Size of fish 5.0\%
30. Are you satisfied with the current size limits (None) and creel limits ( 15 fish) on white bass at Taylorsville Lake? ( $n=38$ ) Yes 100.0\% No 0.0\%

## Hybrid Striped Bass Anglers

31. In general, what level of satisfaction or dissatisfaction do you have with hybrid striped bass fishing at Taylorsville Lake? ( $\mathrm{n}=37$ ) Very satisfied 13.5\% Somewhat satisfied 29.7\% Neutral 8.1\% Somewhat dissatisfied 35.1\% Very dissatisfied $\mathbf{1 3 . 5 \%}$

13a. If you responded with very or somewhat satisfied in question (13) - What is the single most important reason for your Satisfaction? ( $n=15$ )
Number of fish 53.3\% Size of fish 40.0\% Creel Limit 6.7\%
13b. If you responded with somewhat or very dissatisfied in question (13) - What is the single most important reason for your Dissatisfaction? ( $\mathrm{n}=18$ )
Number of fish $\mathbf{9 4 . 4 \%}$ Size of fish 5.6\%
32. Are you satisfied with the current size limits (None; only 5 may be over 15 inch) and creel limits ( 15 fish) on hybrid striped bass at Taylorsville Lake? ( $n=36$ ) Yes 100.0\% No 0.0\%

## Channel Catfish Anglers

33. In general, what level of satisfaction or dissatisfaction do you have with channel catfish fishing at Taylorsville Lake? ( $\mathrm{n}=61$ ) Very satisfied 36.1\% Somewhat satisfied 52.5\% Neutral 3.3\% Somewhat dissatisfied 8.2\% Very dissatisfied 0.0\%

15a. If you responded with very or somewhat satisfied in question (15) - What is the single most important reason for your Satisfaction? ( $n=51$ )
Number of fish 60.8\% Size of fish 31.4\% Size Limit 2.0\% Creel Limit 3.9\% Low Angler Pressure 2.0\%
15b. If you responded with somewhat or very dissatisfied in question (15) - What is the single most important reason for your Dissatisfaction? ( $n=5$ )
Number of fish 80.0\% Too many jugs/over fished 20.0\%
34. Are you satisfied with the current size limits (Only 1 fish may be longer than 25 inches) and creel limits ( 15 fish) on channel catfish at Taylorsville Lake? ( $\mathrm{n}=47$ ) Yes 76.6\% No 23.4\%

16a. If not, what would you prefer? $(\mathrm{n}=9)$ 10 fish creel 11.1\% 10 fish creel, 2 over 25 in 11.1 \% 20 fish creel 22.2\% 2 over 25 in 11.1\% Keep more over 25 in 33.3\%

## Blue Catfish Anglers

35. In general, what level of satisfaction or dissatisfaction do you have with blue catfish fishing at Taylorsville Lake? ( $n=73$ ) Very satisfied 67.1\% Somewhat satisfied 27.4\% Neutral 5.5\% Somewhat dissatisfied 0.0\% Very dissatisfied 0.0\%

17a. If you responded with very or somewhat satisfied in question (17) - What is the single most important reason for your Satisfaction? $(n=60)$
Number of fish 35.0\% Size of fish 61.7\% Size Limit 1.7\% Low Angler Pressure 1.7\%
36. Are you satisfied with the current size limits (Only 1 fish may be longer than 25 inches) and creel limits ( 15 fish) on blue catfish at Taylorsville Lake? ( $\mathrm{n}=63$ ) Yes 39.7\% No 60.3\%

18a. If not, what would you prefer? ( $n=43$ )

Keep 1 fish over 30 in $\mathbf{2 . 3}$ \% Keep 2 fish over 30 in 7.0\% Keep 1 over 30 in, 10 fish creel 7.0\% Keep 2 fish over 25 in $\mathbf{1 1 . 6 \%}$ Keep 2 fish over 25 in, 25 fish creel 2.3\% 30 in size limit, 10 fish creel $\mathbf{7 . 0} \% \quad 30$ in size limit $\mathbf{4 4 . 2 \%} \quad 36$ in size limit 4.7\% Keep more fish over 25 in 9.3\% No limits 2.3\% Reduce size limit 2.3\%

## All Anglers

37. Have you ever fished for catfish at Taylorsville Lake with jugs/noodles? ( $n=191$ ) Yes 38.7\% No 61.3\%
38. This legal method of fishing has become a popular method of fishing for catfish at Taylorsville Lake. Has jug fishing affected your fishing experience at Taylorsville Lake? $(\mathrm{n}=187) \quad$ Yes 11.2\% No 88.8\%
39. If so, how often has it affected your fishing experience? ( $\mathrm{n}=23$ ) Always 0.0\% Often 17.4\% Sometimes 52.2\% Rarely 30.4\%
40. If so, how has jug fishing caused a problem with your fishing experience at Taylorsville Lake? ( $n=21$ )

To many jugs 19.0\% Navigation problem 52.4\% Don't like jug fishing 4.8\% Taking to many fish 5.3\%
Bass fishermen are rude 4.8\% Lack of respect on where jugs are set 4.8\% Trashing the lake 4.8\% All of the above 4.8\%

Table 43. Species composition, relative abundance, and CPUE (fish/hr) of crappie collected in 4.5 hours of 15-minute electrofishing runs in Herrington Lake, March 2016; numbers in parentheses are standard errors.

| Location/Species | Inch class |  |  |  |  |  |  |  |  |  |  |  |  |  | Total | CPUE |

# Kentucky Department of Fish and Wildlife Resources 

## AJ JOLLY LAKE ANGLER ATTITUDE SURVEY 2016

(Based on 74 surveys)

1. Have you completed this survey this year? $\underline{\mathbf{1 2 . 2} \%}$ Yes $87.8 \%$ No
2. In general, what level of satisfaction or dissatisfaction do you have with fishing at AJ Jolly Lake? ( $n=73$ )
21.9\% Very satisfied $34.2 \%$ Somewhat satisfied $27.4 \%$ Neutral $12.3 \%$ Somewhat dissatisfied 4.2\% Very dissatisfied

2a. If you responded with very or somewhat satisfied in question (2) - What is the single most important reason for your Satisfaction? ( $\mathrm{n}=55$ )
34.5\% Number of fish $21.8 \%$ Size of fish $3.6 \%$ Size Limit $\quad$ 1.8\% Creel Limit $16.4 \%$ Low Angler Pressure 21.9\% Other (close to home, campground, shoreline access, species variation, balanced lake, pleasant atmosphere)

2b. If you responded with somewhat or very dissatisfied in question (2) - What is the single most important reason for your Dissatisfaction? ( $n=13$ )
84.6\% Number of fish $15.4 \%$ Size of fish
3. Are you satisfied with the current size limits and creel limits at AJ Jolly Lake? ( $n=68$ )

## 97.1\% Yes 2.9\% No

If not, what would you prefer (not sure what the size limits are currently, just not great fishing)
4. In general, what level of satisfaction or dissatisfaction do you have with the current facilities, boat ramp and courtesy dock at AJ Jolly Lake? ( $\mathrm{n}=69$ )
37.7\% Very satisfied $\quad$ 30.4\% Somewhat satisfied $\quad$ 27.5\% Neutral 4.3\% Somewhat dissatisfied 0\% Very dissatisfied
5. If you were able to choose the type of fisheries management at A.J. Jolly Lake, which of the following scenarios would be your number one choice? $(\mathrm{n}=71)$
9.9\% High numbers of small bluegill ( $3-5$ inches) and low numbers of quality bass ( $13-20$ inches), which could be hard to catch at times. (Quality Bass Management)
63.4\% Average numbers of quality bluegill (hand-sized) and average numbers of quality bass ( $8-14$ inches)I (Balanced Bass and Bluegill Management)
$\mathbf{1 1 . 3 \%}$ High numbers of smaller easily caught bass (generally under the 12 inch size limit) and lower numbers of quality bluegill (hand-size or bigger) (Quality Bluegill Management)
15.4\% Don't fish for bass or bluegill or No Opinion

Table 78. Length frequency, relative abundance, and CPUE (fish/hr) of largemouth bass collected in 2.0 hours of 15-minute electrofishing runs in Beaver Lake, April 2016; numbers in parentheses are standard errors.

# NORTHEASTERN FISHERY DISTRICT 

## Project A: Lake and Tailwaters Fishery Surveys

## FINDINGS

All sampling conditions can be found in Table 1. This includes dates, temperatures, secchi depths and any other pertinent sampling information during the sampling events.

## Cave Run Lake (8,720a)

Muskellunge sampling
On March 15-17, the upper, middle and lower sections of Cave Run Lake were sampled for assessment of the muskellunge fishery. In total, 106 fish were collected with nearly half of those coming from the lower portion of the lake (Table 2). Overall relative weights continue to be in the upper $80 \%$ to lower $90 \%$ range and 2016 did not deviate much from the 2003-2014 average (Table 3). Once again, average length and weight of known-age fish was determined from marked members of the population. In Cave Run Lake, the fish tend to reach the minimum size limit of 36.0 inches in their fourth year and have the potential to exceed 40.0 inches in their fifth or sixth year (Table 4). Mean length and weight was also determined for known-sex fish with females continuing to be slightly longer and heavier than the males captured (Table 5). In 2016 the fishery overall was rated as "Fair" with a score of 9; this is a drop from the 2014 assessment score of 18 (Table 6). In October of 2016, Cave Run Lake was stocked with 2,800 young-of-year muskellunge. Stocked fish continue to be marked to indicate their spawning year as noted in the table below.

| Year | Marking | Number <br> Stocked | Average <br> Length |
| :---: | :---: | :---: | :---: |
| 2016 | Right Cheek Wire Tag | 2,800 | $11.8^{\prime \prime}$ |
| 2015 | Dorsal Fin Wire Tag | 1,307 | $13.0 "$ |
| 2014 | Left Cheek Wire Tag | 2,900 | $13.3 "$ |
| 2013 | Right Pectoral Fin Clip | 2,800 | $12.6^{\prime \prime}$ |
| 2012 | Left Pelvic Fin Clip | 1,923 | $12.4 "$ |
| 2011 | Right Pelvic Fin Clip | 2,800 | $12.8 "$ |
| 2010 | Left Pectoral Fin Clip | 2,811 | $12.5 "$ |

Black bass sampling (Spring/Fall)
On April 18-20, the upper, middle and lower sections of Cave Run Lake were nocturnally electrofished for assessment of the black bass population. In total, 2,312 fish were captured. The majority of these fish were largemouth bass ( $71 \%$ ), followed by spotted bass ( $26 \%$ ) and smallmouth bass ( $3 \%$; Table 7). As is normally the case, the percentage of the population represented by spotted and smallmouth bass increases as you head from the upper sections of the lake to the lower sections of the lake. Catch rates were higher than the 1990-2015 average for all length groups of largemouth bass (Table 8). PSD and $\mathrm{RSD}_{15}$ values for largemouth bass demonstrate the lake has a good balance in size structure (Table 9). In October, fish were collected for determination of age and growth characteristics. From this we learned that on Cave Run Lake fish will enter the slot limit in their third year and exit as early as the forth but more likely the fifth (Table 10). These growth rates continue to show improvement when compared to pre-slot limit findings, but still are much lower than is desired. Overall, the largemouth bass population was rated as "Excellent"; boosted by continued high scores for catch rates of fish in the 12.0- to 14.9-in range, the greater than 15.0 in range, the greater than 20.0 in range and the catch rates of age- 1 fish (Table 11).

The black bass population was again nocturnally electrofished from September 26-28 for assessment of relative weights and relative spawning strength. In total, 823 black bass were captured ranging in size from 2.0 to 20.0 in (Table 12). Of these fish, $57 \%$ were largemouth bass, $40 \%$ spotted bass and $3 \%$ smallmouth bass. Overall, largemouth bass relative weights ranged in the low 80s to the middle 90s (Table 13). Reproductive success for
largemouth bass at Cave Run Lake continues to be exceptionally high and for this reason Cave Run Lake was not stocked with young-of-year largemouth bass in 2016 (Table 14).

## Crappie sampling

Over the first week of November black and white crappie were sampled in the upper reaches of Cave Run Lake with trap nets. The primary objective of this sampling was to collect fish to compare growth rates between trap net sampled fish and fish collected from anglers fishing in this area. In these 32 net nights, 96 crappie were collected ranging in size from 3.0 to 13.0 in (Table 15). As is typical, most of the fish captured were white crappie ( $94 \%$ ). The majority of the fish greater than stock size ( 5.0 in ) were less than 8.0 in , which resulted in PSD and $\mathrm{RSD}_{10}$ values on the lower side (Table 16). Relative weights were in the upper 70s to mid-80s for both black and white crappie (Table 17). In 2015, staff worked with local anglers to obtain otoliths from fish caught in the middle and lower sections of the lake. From this data, large differences were observed when growth rates were compared from fish collected during fall trap netting in the upper sections of the lake and fish angled in the middle and lower sections of the lake. To determine if this was a difference in growth rates between the upper and middle/lower sections of the lake or gear selectivity of the fish, staff again worked with local anglers in 2016. Staff obtained otoliths for fish caught in the upper section of the lake by angling and compared those growth rates to fish caught through trap netting in the upper part of the lake. Through this, we observed very little difference between crappie growth rates with these two different sampling methods (Table 18). It could be concluded then, that the differences observed in 2015 are in fact related to growth. The major difference between these two areas is the harvest rate, with increased angler pressure in the lower 2/3's of the lake due to increases in habitat sites and availability. Cave Run Lake crappie serve to demonstrate that in low nutrient systems increased harvest by anglers can improve growth rates of fish. The overall assessment of the white crappie fishery at Cave Run Lake was again "Poor" in 2016 (Table 19). These results should, be taken with caution as sampling was only conducted in the upper reaches of the lake, and traditional sampling techniques are difficult to use on Cave Run Lake. Further, anecdotal reports suggest that anglers continue to experience excellent crappie fishing- particularly in the middle and lower portions of the lake.

## Grayson Lake (1,512a)

## Black bass sampling (Spring/Fall)

The black bass population of Grayson Lake was nocturnally electrofished from April 25-26. In total, 1,082 fish were collected ranging in size from 3.0 to 21.0 in (Table 20). The majority of these fish ( $83 \%$ ) were largemouth bass followed by spotted bass ( $17 \%$ ) and smallmouth bass ( $<1 \%$ ). Unlike previous years, only the middle and lower sections of the lake were sampled, as low water conditions prohibited sampling in the upper reaches. Catch rates by length group were, across the board, higher than the average from 1999-2015 (Table 21). PSD and RSD 15 values were on the lower side overall (Table 22) and the assessment of the largemouth bass fishery at Grayson Lake was "Fair" (Table 23).

From September 19-21, Grayson Lake was nocturnally electrofished for determination of spawning strength of largemouth bass. All assessment parameters were among the highest seen since 2003 (Table 24) and the lake was not stocked with young of year largemouth bass in 2016

## Hybrid striped bass sampling (Fall)

From October 18-21, Grayson Lake was gill netted for assessment of the hybrid striped bass fishery. Due to the narrow nature of Grayson Lake, 125 -foot, 5 panel gill nets were used, rather than the standard 250 -foot, 5 panel nets. Comparisons between the Grayson Lake data and data collected from other lakes should be made with caution due to this gear difference. In total, 78 hybrid striped bass were collected ranging in size from 7.0 to 24.0 in (Table 25). Similar to 2014, relative weights were in the low 80 's (Table 26). In addition to the length and weight data, otoliths were collected for determination of age and growth characteristics. Generally speaking, these fish exhibit reasonably good growth rates (mean length at capture of age-2 fish was 17.5 in ), demonstrating the potential to reach 20.0 in by three years old (Table 27). The majority of the population sampled was age- 0 to age- 2 but fish were collected up to age-7 (Table 28). Using the statewide assessment for hybrid striped bass collected with 250foot, 5 panel gill nets, the fishery at Grayson would be rated as "Fair", but these fish were collected using 125-foot, 5 panel nets so these comparisons are most likely invalid. Given more sampling events (minimum of 2 more) an individual lake assessment will be created for the preferred gear at Grayson Lake

## Crappie sampling (Fall)

On October 26, the upper reaches of Grayson Lake were diurnally electrofished for an assessment of the crappie fishery. In total, 232 crappie were collected ranging in size from 5.0 to 11.0 in (Table 30 ). Of these fish, $91 \%$ were white crappie. PSD and $\mathrm{RSD}_{10}$ values were both on the lower side (Table 31) as were relative weights (Table 32). Growth rates for white crappie were excellent; however, when compared to other lakes across the state, values are poor (the fish collected took seven years to reach 10.0 in ; Table 33). The majority of the crappie collected were age1 and age-2 and those fish ranged in size from 6.0 to 8.0 in (Table 34). It should be mentioned (in light of the growth rate differences between the sections of Cave Run Lake) that the only section of Grayson Lake sampled for crappie was the upper section; growth rates may be faster in the lower reaches. Efforts should be made to better sample fish from across the lake in future years. Using an individual lake assessment, the crappie fishery at Grayson is rated as "Good" (Table 35).

## Creel survey

From 01 April to 31 October, a roving creel survey was conducted on Grayson Lake. In 2016 there were significantly more trips and man hours spent on the lake than the previous creel survey (2008), which is most likely a reflection of the poor economic conditions in 2008; the hours and trips spent on the lake is more comparable to the 2002 and 1993 creel surveys (Table 36). As has been the case in previous years, the majority of the users on Grayson Lake are male residents who spend time casting from a boat. The most fished for species on the lake was black bass ( 3843.3 trips), followed by crappie ( 1624.1 trips), hybrid striped bass ( 412.2 trips), catfish ( 363.4 trips) and panfish ( 326.7 trips; Table 37). The most harvested species were crappie and panfish, but the most caught species were crappie and black bass. Anglers had the most success fishing for crappie ( $60.6 \%$ success) and the least for black bass species ( $2.5 \%$ success). All of these trends were similar to those observed in 2008. Table 38 shows the number of fish harvested and released by inch class. This table shows the very low ( $1 \%$ ) harvest rate for largemouth bass, the fact that the majority of crappie are harvested at 8.0 in and that anglers caught hybrid striped bass that were in the 27.0 in class. The most successful times to catch black bass on Grayson were April, May and October which coincided with the most trips made for those species on the lake (Table 39) and this trend also held true for crappie anglers (Table 40). However, early spring and summer fishing was the key for hybrid striped bass anglers (Table 41).

## Angler attitude survey

In conjunction with the creel survey anglers were asked a series of questions pertaining to their attitudes towards fishing on Grayson Lake (Table 42). Anglers were only surveyed once in the year. Overall, the most fished for species were bass, crappie and hybrid striped bass. Of those that fished for bass, $51 \%$ were satisfied and $31 \%$ had a neutral opinion. Those who were not satisfied were disappointed in the size of the fish caught. About a quarter of the bass anglers surveyed fish tournaments at a rate of 7-12 a year. Similarly, the majority of the anglers who fished for crappie were satisfied ( $95 \%$ ) and they were most satisfied with the number of fish they caught and the size of these fish. Both hybrid striped bass anglers and catfish anglers were satisfied with their fishing experiences ( $81 \%$ and $69 \%$, respectively). The majority of our anglers fish 1-4 times a month. Anglers support the 15.0 -inch minimum size limit on largemouth bass ( $84 \%$ ) and the re-introduction of hybrid striped bass ( $96 \%$ ). The majority of anglers rated the habitat in the lake as good (70\%). About two-thirds of all anglers knew of KDFWR's efforts to boost the habitat in the lake, less than half of all anglers regularly fish it and overall, most know about and utilize department placed habitat. Those that fish it have found it on their own and feel that it has improved their fishing.

## Greenbo Lake (181a)

## Black bass sampling (Spring/Fall)

On April 21, Greenbo Lake was nocturnally electrofished to assess the largemouth bass population. A total of 358 fish were collected ranging from 3.0 to 24.0 in (Table 43 ). The catch rate of 15.0 -in and greater bass was the best it has been since 2009. Likewise, the 20.0 -in and greater catch rate was the best it has been since 2006 (Table 44). PSD values show around $50 \%$ of the fish sampled were over 12.0 in (Table 45). Bass at Greenbo Lake are reaching harvestable size ( 12.0 in ) as early as three years old with most reaching this at age four or five (Table 46). The overall largemouth bass assessment was rated as "Good" (Table 47).

On September 21, Greenbo Lake was nocturnally electrofished to assess the spring spawning strength and relative weights of largemouth bass. A total of 172 fish were collected ranging from 2.0 to 16.0 in (Table 48). Catch rate of
bass was down largely due to the dense mats of hydrilla in the shallows. Relative weights of those fish collected were similar to previous years (Table 49) After assessing the lake, it was determined that a supplemental stocking was necessary and on October 11, 980 fingerlings were stocked at a mean size of 4.3 in (Table 50). These fish were spawned as part of KDFWR's "Trophy Bass Propagation Program" as a fish collected from Greenbo Lake was a contributor to this project.

## Miscellaneous

During last year's fall sample (2015), dense aquatic vegetation was found and believed to have been Elodea. This year the mats had increased in size and density. Vegetation was pulled and identified as hydrilla. It is now believed to have been misidentified in 2015. For a second year in a row grass carp were stocked to help combat the increase in vegetation. Forty-eight grass carp averaging 15.0 in were stocked into the lake. Continued evaluation will be needed to determine if an increased stocking rate is required to combat the vegetation.

## Lake Reba (76a)

## Black bass sampling (Spring)

On April 14, Lake Reba was diurnally electrofished for assessment of the largemouth bass population. In total, 264 fish were collected ranging in size from 3.0 to 23.0 in (Table 51). Catch rates by length group were very similar to the 2015 through 1995 average (Table 52). Both PSD and $\mathrm{RSD}_{15}$ values were lower than the 2015 through 1995 average (Table 53). The overall lake assessment saw a drop from "Excellent" to "Good" in 2016. This was due to a decrease in catch rates of fish in the greater than 15.0 -in length group (Table 54). The management objective for catch rates of fish over 15.0 in fell just short of the desired goal but the objective for catch rates of fish over 20.0 in was met.

## Black bass sampling (Fall)

On September 26, Lake Reba was diurnally electrofished for assessment of the spawning strength. Catch rates of age-0 fish were off the charts and the lake was not stocked in 2016 (Table 55).

## Smoky Valley Lake (36a)

## Black bass sampling (Spring)

On April 15, Smoky Valley Lake was diurnally electrofished for assessment of the largemouth bass population. In total, 240 fish were collected ranging in size from 3.0 to 15.0 in (Table 56). As has been the trend for the last several years, catch rates of fish in each category over 12.0 in were much lower than the 1990 to 2015 average (Table 57). PSD and $\mathrm{RSD}_{15}$ values were very low indicating the majority of the fish were under the 12.0 -in mark (Table 58). In the fall, otoliths were collected to determine age and growth characteristics and this demonstrated the continuation of the slow growth rates (Table 59). The bass population at Smoky Valley Lake was rated as "Fair" in 2016.

## Sunfish sampling (summer)

On May 16, Smoky Valley Lake was diurnally electrofished for assessment of the sunfish populations. In total, 153 sunfish were collected (Table 61). The majority of these fishes were bluegill ( $76 \%$ ) followed by green sunfish ( $22 \%$ ) and longear sunfish ( $2 \%$ ). Catch rates of bluegill by length group were down across the board (Table 62) and very few of the stock-size fish were above 6.0 in (Table 63). Otoliths were collected for determination of age and growth characteristics and these demonstrate the slow growth of this population (Table 64) as well as a wide range of lengths of fish of the same age (Table 65). The overall assessment of the bluegill fishery at Smoky Valley Lake was "Fair" (Table 66).

## Black bass sampling (Fall)

On October 07, Smoky Valley Lake was diurnally electrofished in order to obtain relative weights of largemouth bass. In total, 228 fish were sampled ranging in size from 3.0 to 15.0 in (Table 67). Relative weights were also much lower than the 1990 to 2015 average (Table 68).

## Lake Wilgreen (131a)

## Black bass sampling (Spring)

On May 18, Lake Wilgreen was diurnally electrofished for an assessment of the largemouth bass population. In total, 606 fish were collected ranging in size from 2.0 to 21.0 in (Table 69). Catch rates of fish in the greater than 15.0 -in and greater than 20.0-in range were much higher than the 1990-2015 average, but catch rates of some of the smaller length groups were lower (Table 70). This has been a recent trend and since there doesn't appear to be a decline in fish moving through the population over time, there is little concern. PSD and $\mathrm{RSD}_{15}$ values reflect these higher numbers of larger fish with nearly $50 \%$ of fish over stock size exceeding 15.0 in (Table 71). In the fall, otoliths were collected from a subsample of fish in order to determine age and growth characteristics. These samples showed continued excellent growth in Lake Wilgreen (Table 72). The overall assessment of the fishery at Lake Wilgreen was "Excellent" with nearly perfect scores across the board (Table 73).

Sunfish sampling (summer)
On May 18, Lake Wilgreen was diurnally electrofished for assessment of the sunfish populations. In total, 1,052 sunfish were collected; of these $82 \%$ were bluegill, $13 \%$ were green sunfish and $3 \%$ were redear sunfish (Table 74). Catch rates of bluegill were similar to the 1990-2015 average, with the exception of the smaller fish which were higher than average and the larger fish which were below average (Table 75). This lower number of larger fish resulted in relatively lower PSD and $\mathrm{RSD}_{8}$ values (Table 76). Otoliths were also collected from a subsample of 10 individuals from each inch class. This data showed fair growth rates with fish reaching 6.0 in by their third year (Table 77), and that the majority of the fish within the population were less than four years old (Table 78). The overall assessment of the bluegill fishery in Lake Wilgreen was "Fair" (Table 79). While very few redear sunfish were collected in our sample, our catch rates were not far off of the 1995-2015 average (Table 80). Of those fish collected, $63 \%$ of them were greater than 7.0 in , but none were over the 10.0-in mark (Table 81). Otoliths were also collected from redear sunfish and showed pretty slow growth rates (Table 82), and that the majority of the fish collected were around four years old (Table 83). The overall assessment of the redear sunfish fishery was "Poor" (Table 84); however, it should be noted that we have some difficulty sampling redear sunfish, as they generally are a little deeper and out of electrofishing range.

## Black bass sampling (Fall)

On October 10, Lake Wilgreen was electrofished for assessment of relative weights of largemouth bass. In total, 373 fish were sampled ranging in size from 2.0 to 19.0 in (Table 85). Relative weights were in the mid-80s to mid90 s (Table 86). These values were very close to the average of values obtained between 1990 and 2015.

Table 1: Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body | Species | $\begin{gathered} \text { Date } \\ (2016) \end{gathered}$ | Time 24hr | Gear | Weather | Water Temp ( ${ }^{\circ} \mathrm{F}$ ) | Water level | Secchi (in) | Conditions | Pertinent sampling comments |

Table 42: Angler attitude survey carried out in conjunction with 2014 creel survey on Grayson Lake. 2. Which species do you fish for at Grayson Lake (check all that apply)? ( $\mathrm{N}=60$ )

Bass=56.7\%; Crappie= 33.3\%; Hybrid Striped Bass=18.3\%; Catfish= 21.7\%; Bluegill= 3.3\%
3. Which species do you fish for most at Grayson Lake (check only one)?

Bass $=54.8 \%$; Crappie $=\mathbf{3 2 . 3 \%}$; Catfish= 9.7\%; Hybrid Striped Bass=3.2\%

## Bass Anglers

4. What level of satisfaction do you have with bass fishing at Grayson Lake? ( $\mathrm{N}=35$ )

| Very Satisfied | $11.4 \%$ | Somewhat Satisfied | $40.0 \%$ | Total | $51.4 \%$ |
| :--- | :--- | :--- | ---: | :--- | :--- |
| Very Dissatisfied | $0.0 \%$ | Somewhat Dissatisfied 14.3\% | Total | $14.3 \%$ |  |
| Neutral | $31.4 \%$ | No Opinion | $2.9 \%$ |  |  |

4a. If angler responds with somewhat or very satisfied in question 5: what is the single most important reason for your satisfaction?
*Note: These numbers are percentages ONLY of those who were satisfied (51.4\%)

| Number of Fish | $57.9 \%$ | Size of Fish | $36.8 \%$ |
| :--- | :--- | :--- | :--- |
| Regulations | $5.3 \%$ |  |  |

4b. If angler responds with somewhat or very dissatisfied in question 5: what is the single most important reason for your dissatisfaction?
*Note: These numbers are percentages ONLY of those who were dissatisfied (14.3\%)
Size of Fish 83.3\% Number of Fish 16.7\%
4c. If angler responds that the are unhappy with the regulations (4b.): What type of regulation would you prefer to see on bass at Grayson Lake? ( No Responses)
5. Do you fish bass tournaments on Grayson Lake? ( $\mathrm{N}=33$ )

Yes $=27.3 \% \quad \mathbf{N o}=72.7 \%$
5a. If angler answers "Yes": About how many bass tournamnets did you fish on Grayson Lake in the last 12 months? ( $\mathrm{N}=8$ )
$\mathbf{1 - 6}=37.5 \% \quad \mathbf{7 - 1 2}=62.5 \% \quad \geq \mathbf{1 3}=0 \%$

## Crappie Anglers

6. What level of satisfaction do you have with crappie fishing at Grayson Lake? ( $\mathrm{N}=20$ )

| Very Satisfied | $45.0 \%$ | Somewhat Satisfied | $50.0 \%$ | Total | $95.0 \%$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Very Dissatisfied | $0.0 \%$ | Somewhat Dissatisfied $0.0 \%$ | Total | $0.0 \%$ |  |
| Neutral | $5.0 \%$ | No Opinion | $0.0 \%$ |  |  |

6a. If angler responds with somewhat or very satisfied in question 5: what is the single most important reason for your satisfaction?
*Note: These numbers are percentages ONLY of those who were satisfied (95.0\%)
Number of Fish $63.2 \% \quad$ Size of Fish 36.8\%
6b. If angler responds with somewhat or very dissatisfied in question 5: what is the single most important reason for your dissatisfaction? (No Responses)
*Note: These numbers are percentages ONLY of those who were dissatisfied (0\%)

## Hybrid Striped Bass Anglers

7. What level of satisfaction do you have with hybrid striped bass fishing at Grayson Lake? ( $\mathrm{N}=11$ )

| Very Satisfied | $54.5 \%$ | Somewhat Satisfied $27.3 \%$ | Total | $81.8 \%$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Very Dissatisfied | $0.0 \%$ | Somewhat Dissatisfied $0.0 \%$ | Total |  |  |
| Neutral | $18.2 \%$ | No Opinion | $0.0 \%$ |  |  |

7a. If angler responds with somewhat or very satisfied in question 5: what is the single most important reason for your satisfaction?
*Note: These numbers are percentages ONLY of those who were satisfied (27.3\%)

## Number of Fish 55.6\%

Size of Fish $\quad 44.4 \%$
7b. If angler responds with somewhat or very dissatisfied in question 5: what is the single most important reason for your dissatisfaction? (No responses)
*Note: These numbers are percentages ONLY of those who were dissatisfied ( $1.2 \%$ )

## Catfish Anglers

8. What level of satisfaction do you have with catfish fishing at Grayson Lake? ( $\mathrm{N}=13$ )

| Very Satisfied | $0.0 \%$ | Somewhat Satisfied $69.2 \%$ | Total | $69.2 \%$ |
| :--- | :--- | :--- | :--- | :--- |
| Very Dissatisfied | $0.0 \%$ | Somewhat Dissatisfied 7.7\% | Total | $7.7 \%$ |
| Neutral | $23.1 \%$ | No Opinion |  |  |

8a. If angler responds with somewhat or very satisfied in question 5: what is the single most important reason for your satisfaction?
*Note: These numbers are percentages ONLY of those who were satisfied ( $69.2 \%$ )

| Size of Fish | $88.9 \%$ |
| :--- | :--- |
| Number of Fish | $11.1 \%$ |

8b. If angler responds with somewhat or very dissatisfied in question 5: what is the single most important reason for your dissatisfaction?
*Note: These numbers are percentages ONLY of those who were dissatisfied (1.2\%)
Number of Fish
11.1\%
9. What method categorizes your most used method of catfish fishing at Grayson Lake? ( $\mathrm{N}=10$ )

| Traditional Hook/Line | 100.0\% | Floating Jugs | $0.0 \%$ |
| :--- | :--- | :--- | :--- |
| Handfishing | $0.0 \%$ | Limb/Trotline | $0.0 \%$ |

10. What species of catfish do you primarily targer while fishing at Grayson Lake? ( $\mathrm{N}=12$ )
$\begin{array}{llllll}\text { Channel Catfish } & 8.3 \% & \text { Flathead Catfish } & 8.3 \% & \text { Either } & 83.30 \%\end{array}$
All Anglers
11. On average, how many times do you fish Grayson Lake each month? ( $\mathrm{N}=60$ )

$$
\leq \mathbf{1}=\quad 5.0 \% \quad \mathbf{1 - 4}=\quad 61.7 \% \quad \mathbf{5 - 1 0}=\quad 21.7 \% \quad \geq \mathbf{1 0}=\quad 11.7 \%
$$

12. Do you support or oppose the current $15^{\prime \prime}$ minimum size limit on largemouth bass at Grayson Lake?
( $\mathrm{N}=59$ )
Support $71.2 \% \quad$ Oppose $18.6 \% \quad$ No Opinion $10.2 \%$
12a. What largemouth bass size limit do you prefer at Grayson Lake? ( $\mathrm{N}=53$ )

| Keep it as it is | $73.6 \%$ | Catch and release | $3.3 \%$ |
| :--- | :--- | :--- | :--- |
| No size limit | $3.8 \%$ | $\mathbf{1 3}$ " MSL | $3.8 \%$ |
| 14" MSL | $3.8 \%$ | $\mathbf{1 3 - 1 5}$ " slot limit | $3.8 \%$ |
| 12-15" slot limit | $1.9 \%$ | $\mathbf{1 2 - 1 6}$ ' slot limit | $1.9 \%$ |
| $\mathbf{1 2}$ " MSL | $1.9 \%$ | Close during spawn | $1.9 \%$ |

13. Do you support or oppose the re-introduced hybrid striped bass? $(\mathrm{N}=54)$
Support $\quad 96.3 \%$ Oppose $\quad 3.7 \%$

13a. If angler responds with opposed: What is the single most important reason for your opposition?
( $\mathrm{N}=3$ )
Their impact on Bass $\quad 66.7 \%$ I don't fish for them $33.3 \%$
14. Have you targeted the recently re-introduced hybrid striped bass? ( $\mathrm{N}=60$ )

Yes $\quad 51.7 \%$ No $48.3 \%$
15. How would you rate the existing fish habitat on Grayson Lake (Both natural and Department)?
( $\mathrm{N}=59$ )

| Very Good | $1.7 \%$ | Good | $67.8 \%$ | Total | $69.5 \%$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Fair | $27.1 \%$ | No Opinion | $1.7 \%$ |  |  |
| Very Poor | $0.0 \%$ | Poor | $1.7 \%$ | Total | $1.7 \%$ |

16. Were you aware the department places fish habitat within the lake? ( $\mathrm{N}=59$ )

$$
\text { Yes }=62.7 \% \quad \text { No }=37.3 \%
$$

17. Do you regularly fish the department habitat? ( $\mathrm{N}=43$ )

$$
\text { Yes }=46.5 \% \quad \text { No }=53.5 \%
$$

Table 42: (Con't)
18. How did you find these attrators/structures at Grayson? ( $\mathrm{N}=47$ )

## On my Own = 53.3\% Friend/Word of Mouth= 3.3\% $\quad$ KDFWR Website $=21.7 \%$

19. Do you feel fishing the department placed habitat has improved your fishing results? $(\mathrm{N}=40)$

$$
\text { Yes }=87.5 \% \quad \text { No }=7.5 \% \quad \text { No Opinion }=5.0 \%
$$

20. Were you aware that the locations of all department placed fish attractors/structures are availiable

$$
\text { on KDFWR website? ( } \mathrm{N}=39 \text { ) }
$$

$$
\text { Yes }=69.2 \% \quad \text { No }=30.8 \%
$$

# SOUTHEASTERN FISHERY DISTRICT 

Project A: Lake and Tailwater Fishery Surveys

## FINDINGS

Conditions encountered during sampling at southeastern district lakes are listed in Table 1.

## Lake Cumberland (50,250 acres)

Lake levels in Lake Cumberland rose to 705 msl in 2013 and 723 msl in 2014 with the completion of repairs to Wolf Creek Dam. Sampling completed after 2013 was conducted in areas that were sampled prior to 2007. Samples from 2007-2012 were conducted in areas farther downstream in the embayments due to reduced water levels; therefore, any comparisons of the 2007-2012 data should be interpreted accordingly.

## Black Bass Sampling (Spring)

Diurnal electrofishing studies were conducted at Wolf Creek dam, and in the Faubush Creek, Fishing Creek, and Lily Creek embayments of Lake Cumberland during May 2016 to assess the black bass populations. The lengthfrequency and catch-per-unit-effort (CPUE) of the three black bass species collected in each area is shown in Table 2. The catch-per-hour (by area and length group) of the three black bass species are shown in Tables 3-6. Catch rates for black bass in Lake Cumberland were consistent with catch rates observed in 2015. Table 7 compares the catch-per-hour by length group of black bass in Lake Cumberland to other SEFD lakes sampled in 2016.

Largemouth bass catch rates met three of the four CPUE management objectives (Table 8). The spotted bass and smallmouth bass populations both met two of the CPUE management objectives (Tables 9 and 10, respectively).

Largemouth bass populations exhibited excellent size structure, with a PSD value of 71 and an $\mathrm{RSD}_{15}$ value of 40 (Table 11). Smallmouth bass and spotted bass populations had a good size structure, with a PSD value of 66 and an $\mathrm{RSD}_{14}$ value of 47 for smallmouth bass and a PSD value of 58 and an $\mathrm{RSD}_{14}$ value of 15 for spotted bass (Table 11). Table 12 compares the size structure of black bass populations in Lake Cumberland to other SEFD lakes sampled in 2016.

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted in the Fishing Creek embayment during October to index the largemouth bass year class strength (Tables 13 and 14). Catch rates of age-0 largemouth bass were higher in 2016 than rates observed the last two years (Table 14). Table 15 compares the CPUE of age-0 largemouth bass in Lake Cumberland to other SEFD lakes sampled in fall 2016. Relative weight (Wr) values for largemouth bass and spotted bass collected during October sampling are shown in Table 16. Table 17 compares Wr values for black bass in Lake Cumberland to other SEFD lakes sampled in fall 2016. Age-growth data from largemouth bass collected in 2016 from Lake Cumberland is shown in Table 18.

## Walleye and White Bass Sampling

Gill nets were used in November 2016 to evaluate the walleye and white bass populations in the Jamestown/Bugwood, Conley Bottom, and Waitsboro/Burnside areas of Lake Cumberland. A total of 268 walleye were captured in 30 net-nights for a catch rate of 8.9 fish $/ \mathrm{nn}$. Length frequency and CPUE of walleye is shown in Table 19. Walleye ranged from 9.0-23.0 in with the mode being the 16.0 -in class ( 62 fish). Two of the three catch rate management objectives for walleye were met (Table 20). Age-growth data for male and female walleye are shown in Tables 21 and 22, respectively. The age-growth for both sexes combined is shown in Table 23. Seven year-classes were represented in the catch, with the 2015 year class (age-1; 54\%) being most abundant (Table 24). Mean length of age-2+ walleye at capture (19.4 in) met the growth objective of 18.0 in (Table 20). The walleye assessment score was 16 (rating=excellent; Table 25). Relative weight (Wr) values for walleye are shown in Table 26.

A total of 11 white bass were captured in 30 net-nights for a catch rate of 0.4 fish $/ \mathrm{nn}$. Length frequency and CPUE of white bass is shown in Table 19. White bass ranged from 12.0-14.0 in with the mode being the 13.0 -in class ( 5 fish). Due to the low number of white bass collected, additional analyses were not completed.

## Striped Bass Sampling

Gill nets were used in late November 2016 to evaluate the striped bass population in Lake Cumberland. Twenty netnights captured 112 striped bass for a catch rate of 5.6 fish $/ \mathrm{nn}$. Length-frequency and CPUE of striped bass are shown in Table 27. Striped bass ranged from 8.0 to 30.0 in with the mode being the 26.0 -in class ( 15 fish). Three of the four management objectives were met for the striped bass population (Table 28). The age-growth data for striped bass collected during 2016 is shown in Table 29. Ten year-classes were represented in the catch (Table 30). The 2013 (age-3) year class was the most abundant year class collected ( $23 \%$ ), which coincided with the increased (pulsed) stocking rate of approximately 14.0 fish/acre in 2013. Mean length of age- $2+$ fish at capture (2014 year class) was 22.8 in , which met the growth objective ( 21.0 in ) for the striped bass fishery (Table 28). The striped bass assessment score was 12 (rating=good; Table 31). Striped bass collected during walleye and striped bass gill netting were used to evaluate relative weight ( $\mathrm{Wr} \mathrm{)} \mathrm{values} ,\mathrm{which} \mathrm{are} \mathrm{shown} \mathrm{in} \mathrm{Table} \mathrm{32}$.

## 2016 Daytime Creel Survey

A roving daytime creel survey was conducted on Lake Cumberland (50,250 acres) from 1 March-31 October 2016. The lake was split into two sections (lower and upper) and each stratum was designed as a stand-alone survey. The lower lake (Harmon Creek to Indian Creek; 25,014 acres) contained four areas, and the upper lake (Harmon Creek to the upper reaches of the lake; 25,014 acres) had eight areas. The survey was conducted 16 days per month in each section of the lake, and each day consisted of a morning or afternoon period (6-hour time period). Angler counts were conducted at random times within the 6 hour time period. Creel data will be presented for each section: lower lake and upper lake.

## Lower Lake Cumberland Creel Survey

Results from the lower lake creel survey are shown in Tables 33-40. Fishing pressure on the lower lake continues to decline. During the 2016 survey, the total number of fishing trips and fishing pressure was half of the estimated trips and hours observed in 2011. Anglers made an estimated 25,204 fishing trips and expended 132,020 hours ( 5.28 man-hours/acre) during the survey period on the lower lake in 2016. Striped bass anglers accounted for $49 \%$ of all fishing trips to the lower lake, followed by black bass (34\%) and crappie (7\%) anglers.

## Upper Lake Cumberland Creel Survey

Results from the upper lake creel survey are shown in Tables 41-48. Although the number of fishing trips declined slightly in 2016, the total man-hours on the upper lake portion increased from the 2011 survey period. Anglers made an estimated 49,149 fishing trips and expended 273,458 hours ( 10.93 man-hours/acre) during the survey period on the upper lake in 2016. Black bass anglers accounted for $46 \%$ of all fishing trips to the upper lake, followed by anglers fishing for anything (17\%), crappie (17\%), and morone (11\%) anglers.

## Lower Lake Cumberland Angler Attitude Survey

An angler attitude survey was conducted in conjunction with the creel survey to gather angler opinions about the various fisheries in lower Lake Cumberland (Figure 1). A total of 173 anglers were interviewed in the lower lake. Anglers were generally satisfied with all fisheries, except walleye anglers who only had a $31 \%$ satisfaction level. Angler satisfaction for striped bass, black bass, crappie, and catfish had all increased since the 2011 angler attitude survey. If anglers were dissatisfied, they listed the number of fish as the reason for their dissatisfaction. Ninety-one percent of anglers on the lower lake were satisfied with the current regulations on sport fish in Lake Cumberland. Only fifty percent of the anglers on the lower lake were aware that lake sturgeon had been stocked in Lake Cumberland, and sixty-seven percent of the anglers knew that lake sturgeon needed to be immediately released if caught. No anglers interviewed on the lower lake had caught a lake sturgeon.

## Upper Lake Cumberland Angler Attitude Survey

An angler attitude survey was conducted in conjunction with the creel survey to gather angler opinions about the various fisheries in upper Lake Cumberland (Figure 2). A total of 176 anglers were interviewed in the upper lake. With the exception of walleye anglers, anglers were generally satisfied with the fisheries. Only $36 \%$ of the walleye anglers were satisfied, which is a marked decline from $100 \%$ satisfaction in 2011. The number of fish was the reason listed for walleye angler dissatisfaction.

Ninety-four percent of anglers on the upper lake were satisfied with the current regulations on sport fish in Lake Cumberland. Eighty-five percent of the anglers on the upper lake were aware that lake sturgeon had been stocked in Lake Cumberland, and eighty-five percent of the anglers knew that lake sturgeon needed to be immediately released if caught. Anglers on the upper portion of Lake Cumberland reported catching eight lake sturgeon.

## Cumberland Tailwater

## Trout Sampling (Fall)

Nocturnal electrofishing sampling was conducted November 6 and 72016 to assess the trout population in the Lake Cumberland tailwater. Electrofishing was completed in eight different areas of the tailwater. Table 49 has the length-frequency and CPUE for the three trout species collected in each area. Catch rates of rainbow trout (Table 50) and brown trout (Table 51) larger than 15.0 in remain at or below the 21 -year average for the tailwater. Relative weight (Wr) values for each trout species is shown in Table 52.

## Laurel River Lake (6,060 acres)

## Black Bass Sampling (Spring)

Electrofishing sampling was conducted during April and May 2016 to assess the black bass population in Laurel River Lake. Electrofishing was conducted in four areas of the lake: 1) dam, 2) Spruce Creek, 3) Laurel River arm, and 4) upper Craigs Creek. Length-frequency and CPUE of the three black bass species collected in each area is shown in Table 53. The catch-per-hour (by area and length group) of the three black bass species are shown in Tables 54-57. Table 7 compares the catch-per-hour by length group of black bass in Laurel River Lake to other SEFD lakes sampled in 2016.

The largemouth bass population met three of the four catch rate objectives (Table 58). Spotted bass met one of the four catch rate management objectives (Table 59). The smallmouth bass population met one of the four catch rate management objectives (Table 60).

Largemouth and smallmouth bass exhibited an excellent size structure, with largemouth bass having a PSD value of 72 and an $\mathrm{RSD}_{15}$ value of 32 , and smallmouth bass having a PSD value of 68 and an $\mathrm{RSD}_{14}$ value of 55 (Table 61). The spotted bass population had a good size structure, with a PSD of 46 and an RSD $_{14}$ of 16 (Table 61). Table 12 compares the size structure values of black bass populations in Laurel River Lake to other SEFD lakes sampled in 2016.

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted in the Laurel River arm on 28 September 2016 to index largemouth bass year class strength (Tables 62 and 63). The CPUE of age-0 largemouth bass in 2016 was high, so additional stockings of age-0 bass was not required (Table 63). Relative weight (Wr) values for largemouth and spotted bass collected during September sampling are shown in Table 64.

## Cedar Creek Lake (784 acres; Lincoln Co.)

## Black Bass Sampling (Spring)

Diurnal electrofishing was conducted on 24 May 2016 to assess the largemouth bass population in Cedar Creek Lake. The length-frequency and CPUE of largemouth bass is shown in Table 65. Size structure of largemouth bass was excellent ( $\mathrm{PSD}=72, \mathrm{RSD}_{15}=50$; Table 66). The catch-per-hour (by area and length group) of largemouth bass for 2003-2016 is shown in Table 67. All four of the CPUE management objectives for the largemouth bass population were met or exceeded (Table 68).

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted on 5 October 2016 to index the largemouth bass year-class strength (Tables 69 and 70). Catch rates of age-0 bass in 2016 were the highest seen since KDFWR began assessing age- 0 year-class strength in 2004 (Table 70). Relative weight (Wr) values for largemouth bass are found in Table 71.

## Bluegill/Redear Sunfish Sampling

Diurnal electrofishing was conducted on 6 June 2016 to assess the bluegill and redear sunfish populations in Cedar Creek Lake. The length-frequency and CPUE of bluegill and redear sunfish is shown in Table 72. The catch-perhour (by length group) of bluegill and redear sunfish is shown in Table 73. PSD and RSD values for bluegill and redear sunfish are shown in Table 74.

## Laurel Creek Reservoir (43 acres; McCreary Co.)

Largemouth Bass Sampling (Spring)
Diurnal electrofishing was conducted on 20 April 2016 at Laurel Creek Reservoir to assess the largemouth bass population. Length frequency and CPUE for largemouth bass is shown in Table 75. Catch-per-hour (by length group) for largemouth bass is shown in Table 76. The largemouth bass size structure was marginal, with a PSD value of $60\left(\mathrm{RSD}_{15}=5\right.$; Table 77).

## Liberty Lake (81 acres; Casey Co.)

Largemouth Bass Sampling (Spring)
Diurnal electrofishing was conducted on 26 April 2016 at Liberty Lake to assess the black bass population. Length frequency and CPUE for black bass is shown in Table 78. Catch-per-hour (by length group) for largemouth and spotted bass is shown in Table 79. Largemouth and spotted bass both exhibited poor size structure, with largemouth bass having a PSD value of $27\left(\mathrm{RSD}_{15}=1\right)$ and spotted bass having a PSD value of $13\left(\mathrm{RSD}_{14}=2\right.$; Table 80$)$.

Largemouth Bass Sampling (Fall)
Diurnal electrofishing was conducted on 30 September 2016 at Liberty Lake to collect largemouth bass to determine age-growth. Age-growth data from largemouth bass collected in 2016 is shown in Table 81. Relative weight values for largemouth bass are in Table 82.

## Wood Creek Lake (625 acres; Laurel Co.)

## Black Bass Sampling (Spring)

Diurnal electrofishing was conducted on 20 May 2016 in the Pump Station and Dock areas of Wood Creek Lake to assess the black bass population. Length frequency and CPUE for black bass are shown in Table 83. The size structure for largemouth bass was marginal, having a PSD value of 42 ( $\mathrm{RSD}_{15}=8$; Table 84 ). The spotted bass population also had a poor size structure ( $\mathrm{PSD}=26, \mathrm{RSD}_{14}=0$; Table 84 ). Catch-per-hour (by length group) for largemouth and spotted bass are shown in Tables 85 and 86, respectively. A largemouth bass population assessment is shown in Table 87. Two of the four catch rate management objectives were met for the largemouth bass population (Table 87).

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted on 26 September 2016 in the Pump Station and Dock areas of Wood Creek Lake to index largemouth bass year class strength (Tables 88 and 89). Catch rates of age-0 largemouth bass in 2016 were high (Table 89); thus, no additional age-0 bass were stocked in the lake during the fall. Relative weight values for largemouth and spotted bass were not available due to an inoperable scale.

Table 1. Summary of sampling conditions by waterbody, species sampled, and date for the Southeastern Fisheries District in 2016.

| Water body Location | Species | Date | $\begin{gathered} \text { Time } \\ \text { (24hr) } \end{gathered}$ | Gear | Weather | Water temp. F | Water level | Secchi <br> (in) | Conditions | Pertinent sampling comments |

## EASTERN FISHERY DISTRICT

Project A: Lake and Tailwater Fishery Surveys

## FINDINGS

Table 1 shows sampling conditions by water body for eastern fishery district lakes in 2016.

## Buckhorn Lake

Muskellunge were sampled via boat electrofishing in early March (Tables 2-3). Fish were sampled from 13.2-44.8 in (Table 2). The 44.8 -in fish was a female that weighed 27.10 lbs . The assessment rating of this fishery continued to be "Fair" (Table 3). If January or early February sampling can be done, this assessment rating is usually higher. Approximately 420 muskellunge ( 11.8 in ) were stocked in October.

Black bass were sampled only during the fall (Tables 4-5). Recent spring assessment ratings for largemouth bass have been "Good". However, with spring and winter rapid water elevation changes at this lake the recruitment success of young fish can fail easily. During 2016 fall sampling, the CPUE of age- 0 and of age- $0 \geq 5.0$ in was very high (Table 5). This 2016 year class should produce good fish numbers in future years.

Additional fish stocking occurred throughout the year at the tailwater area below the dam. Approximately 5,000 rainbow trout (8.0-12.0 in) were stocked during the months of April-June and October-November.

Fall and winter fish habitat work was completed at Buckhorn Lake. During fall, 450 lbs of winter wheat was sowed onto exposed mud flats. In late winter, 11 new pallet structures with Christmas trees were completed.

## Carr Creek Lake

Electrofishing was used to sample black bass in the spring and fall (Tables 6-11). Recent increases seen in CPUE (Table 7) are related to stocking of supplemental fingerling bass in the spring versus previous stockings occurring in the fall. The recent spring stockings occurred in 2013 and 2014. During 2015 and 2016 there were no largemouth bass stockings. Survival of spring-stocked fish has been very good. Largemouth bass PSD values (Table 8) continue to be good, however, the largemouth bass assessment rating lowered to "Fair" (Table 9). Angler success has been good with tournament numbers increasing on weekends as well as during nighttime during the weekdays.

Spring electrofishing was utilized to sample walleye (Tables 12-13). The CPUE of 20.6 fish $/ \mathrm{hr}$ in 2016 was higher than values seen in recent years (Table 12). Fish greater than 24.0 in are low in number and have been for several years as observed from sampling data. An angler creel survey will be conducted in 2017 and may show different results from sampling data in regards to number of fish greater than 24.0 in . This lake provides a large portion of the Erie-strain walleye broodfish for hatchery purposes each year. An estimated 35,000 walleye ( 1.6 in) were stocked in May.

The tailwater was stocked with 1000 rainbow trout/month during the months of $4,5,6,10$, and 11 .
Fish habitat work consisted of fabrication and placement of 37 pallet structures with Christmas trees and hardwood added to them. During winter 2017, the habitat research section will coordinate a large-scale habitat construction project at the lake. One herbicide application was done near the dam intake tower structure for filamentous algae and hydrilla. There continues to be some good areas of beneficial aquatic plants such as sago pondweed and water celery from previous plantings in 2012 and 2013 and expanding areas of floating leaf pondweed and brittle naiad.

## Cranks Creek Lake

Lake conditions only allowed for a fall electrofishing sample of black bass (Tables 14-15). Largemouth and spotted bass are the main black bass species with largemouth bass being dominant. Largemouth bass were sampled from 3.4-22.6 in (Table 14). Fall age-0 CPUE was above average (Table 15). Although age-0 $\geq 5.0$ in CPUE was low (Table 15), no supplemental stocking of fingerling bass occurred in the fall. There continues to be many types of aquatic vegetation due to the clear water at this lake. Brittle naiad has become a nuisance in shallow sections of the upper lake and requires some herbicide application at boat access areas. However, this thick growth of aquatic vegetation has correlated with a trend of increased quality fisheries for largemouth bass, white crappie, and redear sunfish.

Rainbow trout were stocked at a rate of 1,500 fish/mo during January, April, May, and October for a total of 6,000 fish. No fish habitat work was performed in 2016. Harlan County utilized some Reward herbicide for control of naiad at the boat dock and at two boat access points in the upper lake area.

## Dewey Lake

Spring and fall black bass sampling was completed during 2016 (Tables 16-21). Largemouth bass in the spring sample displayed good size distribution through the 4.0 - to 20.0-in classes (Table 16), and the CPUE of fish $\geq 15.0$ in continues to be higher in recent years (Table 17). This increase in fish $\geq 15.0$ in has continued since the low in 2009 following the die-off of hydrilla in the lake. In addition, angler success with numbers of keeper-size fish continues to improve. The largemouth bass assessment rating continued to be "Good" in 2016 (Table 19). An average number of age- 0 fish was observed in the fall with better than average number of age-0 $\geq 5.0$ in (Table 21). No supplemental age-0 fingerling bass were stocked in 2016.

Trap netting was used in the fall to sample black and white crappie. Tables 22-29 contain data for both species. Table 22 lists inch groups and numbers of black and white crappie sampled. A CPUE of 75.4 white crappie/net night and 28.8 black crappie/net night were obtained with 12 net nights of effort (Table 22). Largest age classes were age-2 for white crappie (Table 26) and age-3 for black crappie (Table 27). This provides good numbers for harvest of fish, but mean length of age-2 fish at capture does not meet the desired size of 9.0 in (Tables 28-29). Both species are popular with anglers and attract a lot of fishing effort. The assessment rating for white crappie is "Excellent" (Table 28) and the assessment rating is "Fair" for black crappie (Table 29).

Fish stockings consisted of blue catfish and musky in the lake and rainbow trout in the tailwater. A total of 11,000 blue catfish (4.0-9.0 in) were stocked in April. Muskellunge (7.8 in) were stocked in late July at 550 fish. Rainbow trout were stocked in the tailwater of Dewey Lake in April, May, October, and November (1,000/mo, 8.0-12.0 in).

New and refurbished fish habitat structures were completed. This work consisted of 4 new brushpiles, 8 refurbished brushpiles, 3 new Christmas tree reefs, 6 hinge-cut trees, 2 refurbished stake beds, 5 new stake beds with Christmas trees, and planting of sago pondweed in Stratton Branch. Maintenance was performed at Stratton Branch boat ramp with sediment removal and with mowing of bank access in this area.

## Fishtrap Lake

During 2016, only a fall electrofishing sample was conducted for black bass. Spring water pool elevations prevented sampling during this time. However, spring largemouth bass assessment ratings in recent years of have been "Good". Tables 30-31 display fall black bass sampling data. Black bass CPUE in both the lower and upper lake areas were comparable (Table 30). Smallmouth, spotted, and largemouth bass are present in this lake and anglers catch all regularly. The age-0 largemouth bass numbers were below average (Table 31). Age-0 fish to supplement the 2016 year class were held through the fall at the hatchery and will be stocked in March or April 2017.

Several additional fish stockings occurred during the year at Fishtrap Lake. A total of 11,400 blue catfish (8.0-12.0 in) were stocked in the lake during April. During May, 9,057 (2.3 in) native strain walleye were stocked in the

Levisa Fork River upstream of Fishtrap Lake. Hybrid striped bass totaling 25,408 (1.1 in) were stocked in June. Rainbow trout $(10,750)$ were stocked in the tailwater. Extra trout were stocked in June and came from the Martins Fork Lake tailwater site being rerouted due to warm water temperature.

Fish habitat work consisted of one new hardwood brushpile. Approximately 25 christmas trees were collected and a local fish and game club placed them in the upper end of lake. This work occurred during spring and summer.

A daytime creel survey (2 April-29 October) was conducted at Fishtrap Lake during 2016. Each day that was surveyed consisted of 6 hours on the lake. Dates, times ( 2 periods=morning or afternoon), and order of surveys were randomized. Total angler counts were conducted at the middle of a survey period and the lake was treated as one area. Data obtained is presented in Tables 32-38.

The number of fishing trips and angler hours were slightly greater than the last creel survey in 2006. Both the 2016 (2 April-29 October) and 2006 (8 April-28 October) creels occurred during similar calendar periods. Total fishing trips and angler hours were 5,965 and 28,882, respectively in 2016 (Table 32) and 4,602 and 23,700 , respectively in 2006. Angler harvest success rates when fishing for a particular species at Fishtrap Lake during 2016 were 58.9\% for white crappie, $51.4 \%$ for bluegill/redear, $28.4 \%$ for catfish, $22.9 \%$ for anything, $0.0 \%$ for black bass, and $0.0 \%$ for hybrid striped bass (Table 33). During the survey, both black bass and hybrid striped bass anglers ended with total catch and release of all caught fish. This would account for the $0.0 \%$ angler harvest success rates of both. There were a few black bass and hybrid striped bass harvested, but this was accounted for by the anything, catfish, crappie, and panfish angler groups. Largemouth bass (14,474 fish) were the most numerous caught fish during 2016 (Table 33) and white crappie during 2006 ( 17,439 fish) surveys. Harvest and release numbers for all fish by in class during the survey period are listed in Table 34. Monthly black bass (Table 35), white crappie (Table 36), and hybrid striped bass (Table 37) angling success showed most numerous catches in spring and fall for all three groups.

An angler attitude survey was conducted at the lake to obtain additional information concerning angler preferences. Anglers were asked to answer a series of questions regarding the fishery at Fishtrap Lake. Anglers were surveyed throughout the creel during 2016 with anglers only being asked the questions once. A total of 28 surveys were completed during the lake creel. Black bass at $67.9 \%(\mathrm{~N}=19)$ were the most popular species fished for on the lake followed by catfish at $53.6(\mathrm{~N}=15)$, white crappie at $35.7 \%(\mathrm{~N}=10)$, bluegill/redear at $21.4 \%(\mathrm{~N}=6)$, and hybrid striped bass $10.7 \%(\mathrm{~N}=3)$. Level of fishing satisfaction was asked for several fish groups or species. Angler fishing satisfaction of somewhat satisfied to very satisfied was $79.0 \%$ for black bass, $86.6 \%$ for catfish, $88.9 \%$ for white crappie, $100.0 \%$ for bluegill/redear, and $75.0 \%$ for hybrid striped bass. A total of $28.6 \%$ of attitude survey participants fished tournaments at the lake. Of participants in the attitude survey, approximately $0.0 \%$ used the KDFWR tournament website registration page and approximately $3.6 \%$ utilized this webpage in planning their activity at a particular boat ramp. Additional observations from the attitude survey were that $82.1 \%$ were aware of KDFWR placing fish habitat structures in lake, $75.0 \%$ thought these structures improved their fishing success, and $20.8 \%$ were aware that the positions/GPS coordinates were available on the KDFWR website.

## Martins Fork Lake

No spring sampling data was collected due to flooding and weather issues. Fall electrofishing for black bass and walleye data was conducted, but reduced in time due to a storm event. Table 39 lists length frequencies and CPUE collected in this fall sample. Age-0 largemouth bass numbers were above average (Table 40) and no supplemental stocking of fingerling bass was done. No walleye were collected in this sample. However, anglers are catching some of the native strain walleye in the lake now. The native strain walleye have been stocked annually since 2013. During March 2017, some electrofishing will be conducted to observe if any adult walleye are moving into the two major creek arms of lake for spawning. This will provide information on locations for possible walleye broodfish acquisition in 2018.

Native strain walleye, channel catfish, and rainbow trout were stocked in 2016. A total of 10,030 native strain walleye ( 2.3 in ) were stocked in June. Approximately 4,902 channel catfish (6.0-10.0 in) were stocked. Rainbow trout (750/month) were stocked at the tailwater in months $4,5,6,10$ and 11.

No herbicides were applied for aquatic vegetation and no new fish habitat structures were placed in the lake. For 2017, Christmas tree brushpile construction is planned for the lake.

## Paintsville Lake

Largemouth bass were sampled in the spring and fall (Tables 41-46). Although implemented in 2002, the slot length limit of 12.0-14.9 in has never showed a trend towards increasing fish numbers in the protected slot as expected (Table 42). However, electrofishing catch rates of largemouth bass have been improving for fish $\geq 15.0$ in and $\geq 20.0$ in (Table 42). Additionally, angler reported catch rates are showing similar results with increasing numbers of larger fish. For these reasons, and with high recruitment rates of young fish, the slot length limit regulation has not been changed. The current largemouth bass assessment rated the largemouth bass population as "Fair" (Table 44). The continuation of above average age-0 largemouth bass numbers (Table 46) has not required any supplemental stocking of fingerling bass in Paintsville Lake.

Walleye (Erie strain) were sampled during March for broodfish acquisition. Fish were sampled from 16.0-26.7 in (Table 47). Two of these fish, both females, were removed for broodfish. The two female fish were 23.7 in with a weight of 7.80 lbs and 26.7 in with a weight of 8.70 pounds. A total of 58,034 walleye ( 1.6 in ) were stocked in May.

The lake received a stocking of 4,500 rainbow trout (8.0-12.0 in) during February. Some holdover trout are observed each year during bass and walleye sampling. The tailwater trout fishery received 20,000 rainbow trout from April to November and 300 brown trout in April. Paintsville tailwater occasionally receives additional rainbow trout stockings during the summer due to poor water conditions at other eastern Kentucky stocking locations.

Fish habitat work consisted primarily of new brushpile construction. A total of 10 new brushpiles were constructed from cedar trees and autumn olive. Although several invasive aquatic plants exist at the lake, no herbicide application was necessary throughout the year for control or for removal from public boat access points.

## Pan Bowl Lake

Spring electrofishing was completed for largemouth bass data and population assessment (Tables 48-51). Although PSD and RSD values are low (Table 50), the assessment rating improved from "Fair" to "Good" (Table 51). During 2015, the lake received a supplemental stocking of largemouth bass. This supplemental stocking came from fish removed during the draining of Starfire Lake, Breathit County. A good number of fish stocked were 12.0-20.0 in total length. These fish would have added improvements to several categories of the assessment.

This lake was previously known for its trophy bass fishing. Multiple species of aquatic vegetation have always been present in the lake. However, Eurasian milfoil has become the dominant species filling in open water areas. Some effort has been applied to reducing milfoil with herbicide applications prior to 2013. This was to aid bass predation on sunfish. Additionally, a small number of grass carp were stocked in the lake for management of vegetation during 2014. Improvement of growth rates of young bass is necessary to restore the fishery to prior quality and angler satisfaction.

Management at this 98 acre lake also includes stocking of trout and channel catfish and periodic spring electrofishing for bluegill and redear sunfish. Rainbow trout are stocked annually at 3,000 fish $/ \mathrm{month}$ in March and October. Approximately 1,865 channel catfish (5.0-12.0 in) are stocked in July of even numbered years.

## Yatesville Lake

Electrofishing was utilized to sample black bass during the spring and fall (Tables 52-57). Both sampling efforts were of reduced effort due to water clarity issues and/or rain events. The PSD value typically is at 40 or slightly higher for largemouth bass and the current year had a value of 39 (Table 54). From 2015 to 2016, the spring
assessment rating of largemouth bass dropped from "Good" to "Fair" (Table 55). This is presumed to be a factor of compromised sampling in 2016. Tournaments are numerous at this lake, but the fishery remains consistent. Fall sample data observed above average numbers of age-0 largemouth bass and the highest number of age- 0 fish $\geq 5.0$ in since 2003 (Table 57). There were no supplemental fingerling largemouth bass stocked in the fall.

White crappie were sampled with trap nets in November. A total of 2,581 fish were collected from 3.4-13.5 in for a CPUE of 135.8 fish/net-night (Table 58). Data for PSD/RSD, age and growth, and age frequency can be found in Tables 59-61. Most fish collected were ages 0-2 (Table 61). The assessment rating was "Good", but mean length of age-2 fish at capture decreased to 5.4 in (Table 62). A large age-2 year class is presumed to account for this. Current numbers of larger fish could be down some according to trap net data, however anglers are still doing well catching larger fish.

Rainbow trout were stocked in the tailwater of Yatesville Lake at 750 fish/month for months 4, 5, and 11 (2,250 fish total). Fish habitat work consisted of 2 refurbished brushpiles, 1 refurbished Christmas tree reef, 6 new hardwood brushpiles, 3 new Christmas tree reefs, and 14 hinge-cut trees.

## Fishtrap Lake Angler Attitude Survey 2016

## Frequency Table ( $\mathrm{N}=28$ )

3. Which species of fish do you fish for at Fishtrap Lake?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Bass | 19 | $67.9 \%$ |
| Crappie | 10 | $35.7 \%$ |
| Bluegill/Redear Sunfish | 6 | $21.4 \%$ |
| Catfish | 15 | $53.6 \%$ |
| Hybrid Striped Bass | 3 | $10.7 \%$ |

4. Which one species do you fish for most at Fishtrap Lake?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Bass | 15 | $55.6 \%$ |
| Crappie | 3 | $11.1 \%$ |
| Bluegill/Redear Sunfish | 0 | $0.0 \%$ |
| Cattish | 8 | $29.6 \%$ |
| Hybrid Striped Bass | 0 | $0.0 \%$ |
| Anything | 1 | $3.7 \%$ |
| Total | 27 |  |
| No Response | 1 |  |

5. In general, what level of satisfaction do you have with bass fishing at Fishtrap Lake?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Very satisfied | 6 | $31.6 \%$ |
| Somewhat satisfied | 9 | $47.4 \%$ |
| Neutral | 3 | $15.8 \%$ |
| Somewhat dissatisfied | 1 | $5.3 \%$ |
| Very dissatisfied | 0 | $0.0 \%$ |
| No Opinion | 0 | $0.0 \%$ |
| Total | 19 |  |
| No Response | 9 |  |

5a. If you responded with somewhat or very dissatisfied in question (5) - what is the single most important reason for your dissatisfaction?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Number of fish | 1 | $100.0 \%$ |
| Size of fish | 0 | $0.0 \%$ |
| Not happy with regulatic | 0 | $0.0 \%$ |
| Too many anglers | 0 | $0.0 \%$ |
| Unfamiliar with lake | 0 | $0.0 \%$ |
| Total | 1 |  |
| No Response | 27 |  |

6. In general, what level of satisfaction do you have with crappie fishing at Fishtrap Lake?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Very satisfied | 5 | $55.6 \%$ |
| Somewhat satisfied | 3 | $33.3 \%$ |
| Neutral | 1 | $11.1 \%$ |
| Somewhat dissatisfied | 0 | $0.0 \%$ |
| Very dissatisfied | 0 | $0.0 \%$ |
| No Opinion | 0 | $0.0 \%$ |
| Total | 9 |  |
| No Response | 19 |  |

7. In general, what level of satisfaction do you have with bluegill/redear fishing at Fishtrap Lake?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Very satisfied | 6 | $100.0 \%$ |
| Somewhat satisfied | 0 | $0.0 \%$ |
| Neutral | 0 | $0.0 \%$ |
| Somewhat dissatisfied | 0 | $0.0 \%$ |
| Very dissatisfied | 0 | $0.0 \%$ |
| No Opinion | 0 | $0.0 \%$ |
| Total | 6 |  |
| No Response | 22 |  |

8. In general, what level of satisfaction do you have with catfish fishing at Fishtrap Lake?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Very satisfied | 8 | $53.3 \%$ |
| Somewhat satisfied | 5 | $33.3 \%$ |
| Neutral | 2 | $13.3 \%$ |
| Somewhat dissatisfied | 0 | $0.0 \%$ |
| Very dissatisfied | 0 | $0.0 \%$ |
| No Opinion | 0 | $0.0 \%$ |
| Total | 15 |  |
| No Response | 13 |  |

9. In general, what level of satisfaction do you have with hybrid striped bass fishing at Fishtrap Lake?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Very satisfied | 3 | $75.0 \%$ |
| Somewhat satisfied | 0 | $0.0 \%$ |
| Neutral | 1 | $25.0 \%$ |
| Somewhat dissatisfied | 0 | $0.0 \%$ |
| Very dissatisfied | 0 | $0.0 \%$ |
| No Opinion | 0 | $0.0 \%$ |
| Total | 4 |  |
| No Response | 24 |  |

10. On average, how many times do you fish at Fishtrap Lake in a year?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| First Time | 0 | $0.0 \%$ |
| 1 to 4 | 0 | $0.0 \%$ |
| 5 to 10 | 6 | $21.4 \%$ |
| More than 10 | 22 | $78.6 \%$ |
| Total | 28 |  |
| No Response | 0 |  |

## 11. Do you fish any tournaments?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Yes | 8 | $28.6 \%$ |
| No | 20 | $71.4 \%$ |
| Total | 28 |  |
| No Response | 0 |  |

12. Do you use the KDFWR tournament registration website to register tournaments?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Yes | 0 | $0.0 \%$ |
| No | 28 | $100.0 \%$ |
| Total | 28 |  |
| No Response | 0 |  |

13. Do you use the KDFWR tournament registration website to plan your activity at a particular boat ramp access?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Yes | 1 | $3.6 \%$ |
| No | 27 | $96.4 \%$ |
| Total | 28 |  |
| No Response | 0 |  |

14. How would you rate the existing fish habitat at Fishtrap Lake (both natural and man-made)?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Very good | 6 | $21.4 \%$ |
| Good | 15 | $53.6 \%$ |
| Fair | 7 | $25.0 \%$ |
| Poor | 0 | $0.0 \%$ |
| Very Poor | 0 | $0.0 \%$ |
| No Opinion | 0 | $0.0 \%$ |
| Total | 28 |  |
| No Response | 0 |  |

15. Were you aware KDFWR places fish habitat (e.g. fish attractors/structures) within the lake?

Frequency Percent
Yes 23 82.1\%
No
5 17.9\%
Total
28
No Response
0

## 16. Do you regularly fish Dept. placed attractors/structures at Fishtrap Lake?

|  | Frequency | Percent |
| :--- | ---: | ---: |
| Yes | 14 | $58.3 \%$ |
| No | 10 | $41.7 \%$ |
| Total | 24 |  |

## WESTERN FISHERY DISTRICT

## Project B: Technical Guidance

## FINDINGS

Table 1. Technical guidance given to pond owners in the Western Fishery District during the 2016 project year (April 1, 2016 - March 31, 2017). Approximately 138 telephone calls to the office regarding technical guidance and stocking were also handled. Additionally, numerous emails were replied to requesting farm pond technical guidance information.

| County <br> Pond Owner | Date of Inspection | Findings | Management Recommendations |
| :---: | :---: | :---: | :---: |
| Calloway |  |  |  |
| Harold Hurt | 24-May | fishery balanced, Fil.Algae | stock fathead minnow and grass carp |
| Edward Renfroe | 7-Jun | fish kill, low alkalinity | apply ag. lime, discuss aeration, and restocking |
| Jennifer Garland | 7-Jun | clear water, low dissolved oxygen, low alkalinity, lots small bass | apply ag. lime, stock grass carp, no harvest of bass for 3 year |
| Sammy Cunningham | 14-Oct | low alkalinity, vegetation on levee, clear water | apply ag. lime, clean off levee, fertilize in spring |
| Murray State University - <br> Arboretum | 16-Oct | Shallow, Naiad, Fil.Algae and Creeping Water Primrose, green sunfish | Dig out pond, Dept. stock in 2017 and possible vegetation treatment |
| Dennis Gilbert | 2-Dec | Shallow, muddy water, no bass | apply ag. lime, dig out pond, stock bass |
| Bob Cornelison | 24-May | Bass crowded, Fil.Algae, and Creeping Water Primrose | Remove some of smaller bass, apply copper sulfate, and 2-4-D |
| Christian |  |  |  |
| Jay Tucker | 23-Sep | crappie, stunted bass | remove crappie as caught |
| Graves |  |  |  |
| Justin Myers | 22-May | stunted bass, low dissolved oxygen, vegetation on levee | remove some of bass, stock fathead minnows, clean off levee, add habitat |
| Matthew Wilson | 2-Dec | pond under construction | apply ag. lime, dig out shoreline, stocking, habitat |

## NORTHWESTERN FISHERY DISTRICT

## Project B: Technical Guidance

## FINDINGS

Sixteen on-site pond surveys were provided to six pond owners in 2016 (Table 1). Problems include unbalanced fish populations, excessive amounts of aquatic vegetation, liming and/or fertilization needs and the presence of nuisance fish species. Table 1 contains problems encountered and management recommendations. Many other requests for information and assistance were handled via telephone, e-mail and office visits.

Table 1. On-site technical guidance provided to pond owners in the Northwestern Fishery District in 2016.

| County | Pond/Lake Ow ner | Date | Findings | Recommendations |
| :---: | :---: | :---: | :---: | :---: |
| Breckinridge | KY FFA Camp Lake | 7/28/16 | Excessive HAB | Determine source of nutrients, proceed accordingly |
| Breckinridge | KY FFA Camp Lake | 8/30/16 | Collect data to generate contour map | Drain and dredge, restock |
| Breckinridge | KY FFA Camp Lake | 9/12/16 | Meet in Frankfort w/ DOW, DEP, ACOE... | Drain and dredge, restock |
| Hancock | Vastw ood Park | 11/7/16 | Excessive vegetation, poor access | Work with partners to generate management plan |
| LaRue | McDougal Lake | 10/3/16 | Shallow upper end, no structure, fair sportfish | Low er and dredge, remove undesirables, add structure |
| Hopkins | Mahr Park Lakes | 10/5/16 | Small lakes, limited fish pops, good access | Stock biggest lake and front lake, leave remainder as natural areas |
| Muhlenberg | Green River CC \#1 | 6/9/16 | Shallow w ater, undesirables, decent sportfish | Fertilize Spring 2017, spot treat veg as needed |
| Muhlenberg | Green River CC \#2 | 6/9/16 | Good fish pop, lots vegetation \& shallow w ater | Continue current fish management, spot treat veg as needed |
| Muhlenberg | WHFRTC Pump Lake | 10/18/16 | Good color, fair sportfish pop, $1350 \mu \mathrm{~s}$ | Add structure |
| Muhlenberg | WHFRTC TV Lake | 10/18/16 | Undesirables, good sportfish, $144 \mu \mathrm{~s}$ | Remove undesirables, add structure, new reg 6 LMB 1 over 15 |
| Muhlenberg | WHFRTC Couch Lake | 10/19/16 | Undesirables, good sportfish, $2355 \mu \mathrm{~s}$ | Remove undesirables, add structure, new reg 6 LMB 1 over 15 |
| Muhlenberg | WHFRTC Lime Lake | 10/19/16 | Undesirables, fair sportfish, clear w ater, $627 \mu \mathrm{~s}$ | Add structure |
| Muhlenberg | WHFRTC Washrack Lake | 10/19/16 | Good color, good sportfish, 883 us | New regs 20 sunfish limit, 6 LMB no min size |
| Muhlenberg | WHFRTC Big Reno Lake | 10/19/16 | Undesirables, good color, fair sportfish | Remove undesirables, add structure |
| Muhlenberg | WHFRTC L12 Lake | 10/19/16 | Clear, shallow, excessive veg, bow fin, $2530 \mu \mathrm{~s}$ | Remove bow fin, add structure |
| Muhlenberg | WHFRTC Little Reno Lake | 10/19/16 | Undesirables, good sportfish | Remove undesirables, add structure |

CENTRAL FISHERIES DISTRICT<br>Project B: Stream Fishery Surveys - Warmwater Streams<br>FINDINGS

Stream sampling conditions for 2016 are summarized in Table 1.
Diurnal electrofishing for black bass and rock bass was conducted during March and April 2016 at various locations on Elkhorn Creek. These studies were conducted to assess the black bass, especially smallmouth bass and rock bass populations. Length distribution and CPUE data of black bass and rock bass from Elkhorn Creek are presented in Table 2. Smallmouth bass comprised $59 \%$ of the black bass sampled in the North Fork Elkhorn Creek, whereas, smallmouth bass comprised $92 \%$ of the black bass sampled on the main stem Elkhorn Creek. No spotted bass were collected in North Fork Elkhorn Creek and represented $1 \%$ of the black bass population in the main stem Elkhorn Creek. Largemouth bass comprised $41 \%$ of the black bass sampled in the North Fork Elkhorn Creek and $7 \%$ of the black bass sampled in the main stem Elkhorn Creek. The current catch rate of smallmouth bass ( $162.0 \mathrm{fish} / \mathrm{hr}$ ) is significantly higher than the historical average of 95.0 fish/hr (Table 3). The current catch rate of rock bass (48.8 fish $/ \mathrm{hr}$ ) was much higher than the historical catch rate ( 31.5 fish $/ \mathrm{hr}$ ) (Table 4). The assessment rating values were updated for stream assessments. All assessment tables were updated for these new values, which has changed some of the assessment rating for past years. For this year, the smallmouth bass population assessment score for the North Fork Elkhorn Creek was 15 (Table 5), which results in a "Good" rating. The rock bass population assessment score for North Fork Elkhorn Creek was 12 (Table 6), which results in a "Good" rating. The largemouth bass population assessment score for North Fork Elkhorn Creek was 16 (Table 7), which results in an "Excellent" rating. Fish populations on the North Fork Elkhorn Creek are effected by two dams in the vicinity of the Great Crossing areas. For the main stem Elkhorn Creek, the smallmouth bass population assessment score was 20 (Table 8), which results in an "Excellent" rating. The rock bass population assessment score was 12 (Table 9), which results in a "Good" rating. Finally, the largemouth bass population assessment score was 11 (Table 10), which results in a "Good" rating.

In spring of 2016, otoliths were collected from 109 smallmouth bass collected in the mainstem Elkhorn Creek. Smallmouth bass ranged from 1 to 11 years (Tables 11 and 12). In mainstem Elkhorn Creek, it continues to take approximately $5+$ years to reach the protective slot $12.0-16.0$ inches. Smallmouth bass become vulnerable again around $8+$, when they grow to the upper end of the slot. No major differences were detected in the growth of smallmouth bass collected in the main stem portion of Elkhorn Creek in 2016 when compared to age and growth surveys completed from 1990 through 2002.

Diurnal electrofishing for black bass and rock bass was conducted during April 2016 at various locations on Floyds Fork. These studies were conducted to assess the black bass, especially smallmouth bass and rock bass populations. Length distribution and CPUE data of black bass and rock bass from Floyds Fork are presented in Table 13. Smallmouth bass comprised $64 \%$ of the black bass sampled in Floyds Fork, whereas, largemouth bass comprised $13 \%$ of the sampled black bass. Finally, spotted bass represented $33 \%$ of the black bass population in Floyd's Fork. The catch rate of smallmouth bass on Floyds Fork in 2016 ( 25.7 fish/hr) was higher than the historical average (14.5 fish $/ \mathrm{hr}$ ) (Table 14). However, the catch rate of rock bass ( $9.3 \mathrm{fish} / \mathrm{hr}$ ) was significantly lower than the historical average (11.4 fish/hr) (Table 15). The smallmouth bass population assessment score for Floyds Fork was 15 (Table 16), which results in a "Good" rating. The rock bass population assessment score for Floyds Fork was 6 (Table 6), which results in a "Fair" rating. The largemouth bass population assessment score for Floyds Fork was 7 (Table 7), which results in a "Fair" rating. With the updated assessment values, the assessment rating for smallmouth bass (good) was similar to recent year ratings of "good". The assessment rating for rock bass (fair) was also similar to past years' "fair" ratings. Finally, the assessment rating for largemouth bass (fair) was very similar to previous years.

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body | Species | Date | Time (24hr) | Gear | Weather | Water temp. F | Water level | Secchi (in) | Conditions | Pertinent sampling comments ${ }^{\text {c }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Elkhorn Creek (Hatchery) | Black <br> Bass/ <br> Rock <br> Bass | 3/22 | 1000 | shock | sunny / breezy | 50 | 3.36 ft Peaks Mill gauge | clear | good | good sample |

# CENTRAL FISHERIES DISTRICT 

Project B: Trout Stream Fishery Surveys

## FINDINGS

## Dix River (Herrington Lake tailwater)

The Dix River (Herrington Lake tailwater) was electrofished for trout on November 11, 2016. Results from the electrofishing are presented in Table 1. The CPUE for rainbow trout was $1.3 \mathrm{fish} / \mathrm{hr}$ compared to the historic average of 38.7 fish $/ \mathrm{hr}$. CPUE for brown trout was 0.0 fish/hr compared to the historical average of 26.5 fish $/ \mathrm{hr}$. Historical catch rates of rainbow trout and brown trout are presented in Tables 2 and 3. Annual weather data and tailwater flow parameters for Herrington Lake tailwater are summarized in Table 4. Data is collected from the USGS 03286200 gauge and rainfall data is collected from the USGS 03285000 gauge or National Weather Service ID (DNK2). Tailwater observations appear to have a significant relationship to how the trout perform in Dix River Tailwater. During years of high flow and rainfall, there appears to be lower than average survival of trout from year to year and in some cases a reduction in the overall trout population. During years of low flow or rainfall the trout appear to flourish and high numbers of trout will survive to the next year. Overall, this Dix River tailwater trout fishery is strongly influenced by these yearly variations of weather and water conditions.

A time-lapse camera was installed below the Dix River Dam on June 2, 2016 in an effort to capture angling pressure in response to stocking events. Data was recorded from each of the stocking events occurring during June, July, August, November 2016 and March 2017. Unfortunately, a camera malfunction occurred during January 2017 resulting in no data being collected for that stocking event. Furthermore, the time-lapse camera will remain active until June 1, 2017 in order to collect a full year of angling pressure in the Dix River. Images were collected every 10 minutes during daylight hours, all images collected were analyzed recording total number of anglers, total number of non-anglers, water conditions and fishing mode each day.

Thoughout this period (June 2016-March 2017) at total of 1,000 brown trout and 3,000 rainbow trout were stocked into the Dix River. For the five stocking months with data there was an average of 17.8 anglers/month compared to 19.0 non-anglers/month. Stocking during the summer months (June, July and August) averaged 26.3 anglers/month compared to 5.0 anglers/month during the fall/winter months (November and March). Overall, in the months that were not stocked (September, October and February) there was an average of 8.7 anglers/month.

Data was collected from 245 days between June 2016- March 2017. Of those days, there was 165 days ( $67.3 \%$ ) that the water levels were good for fishing all day. Forty-three days ( $17.6 \%$ ) were impacted by pulsed water releases that resulted in fishable conditions for only a portion of the day and 37 days ( $15.1 \%$ ) were unfishable due to elevated water levels for all or majority of the day. Kayaking ( $45.5 \%$ ) was the most popular fishing mode observed in the Dix River, followed by wade/bank ( $29.9 \%$ ), canoe ( $13.6 \%$ ), motorize boat ( $9.8 \%$ ), stand-up paddle board ( $0.8 \%$ ) and float pontoon ( $0.4 \%$ ).

## Royal Springs

A time-lapse camera was installed at the Georgetown Municipal Water and Sewer Service property adjacent to Royal Springs Park in 2016. The camera was installed in March in an effort to capture angling pressure following each of the stocking events, which occurred in June, July, August and October 2016. The time-lapse camera recorded a picture of the entire fishing area every 15 -minutes during daylight hours. Unfortunately, a camera malfunction occurred and no data was recorded during August (stocking month) and September (non-stocking month). The camera was removed in December. Images were analyzed by recording pressure counts at the top of each hour during daylight hours.

A total of 1,600 (400 fish/stocking) rainbow trout were stocked into Royal Springs during 2016. During the three stocking months with data, an average of 52.6 anglers/month was recorded compared to an average of 3.4 anglers/month during non-stocking months. During the first week following a stocking event, an average of 33.7
anglers ( $64 \%$ ) were recorded, dropping to an average of 11.3 ( $21.5 \%$ ) anglers during the second week and averaged $5.5(10.5 \%)$ anglers during the third week. Average trip length was not calculated, however it does appear that most anglers on average fish less than 30 minutes. Overall, it does appear that the rainbow trout stocked are being utilized and providing a summer-time put and take fishery.

| 2016 | 0 | 0.0 | 0.0 |

Dataset $=$ cfdlfdix.d96-d16

Table 4. Annual weather data and tailwater parameters for Herrington Lake tailwater. Tailwater data is collected from USGS 03286200 gauge and rainfall data is collected from USGS 03285000 gauge or National Weather Service ID (DNK2).

| Year | Annual Average <br> Gauge Height | Annual Average <br> Discharge | Days over 10 feet <br> gauge height | Annual Rainfall for <br> Danville, KY |
| :--- | :---: | :---: | :---: | :---: |
| 2016 | -- | 491.7 |  |  |

Gauge height above 10 feet have probable backwater from Kentucky River.
a In 2010, gauging stations was down for 29.6 days due to extremely high water conditions in the tailwater - 29 days are included.
b In 2014, average gauge height was not recorded until August, therefore, the number of days the gauge exceeded 10 was not calculated. Additionally, gauging station was down for about 20 days during high water events.
c In 2015, the gauging station was down for 41 days during high water events.

## CENTRAL FISHERIES DISTRICT

Project B: Technical Guidance

## FINDINGS

A total of 45 pond owners and 55 ponds were visited in 2016. Most common problems were unbalanced fish populations, excessive aquatic plant growth, lack of fish cover, and the presence of undesirable fish species (Table 1). During our 2016 technical guidance sampling, six landowners requested a Fisheries Special Management Permit (FMP) for their ponds. Finally, a total of 335 phone calls, 255 e-mails, and 4 walk-in office visits concerning farm pond problems were handled this year.

Table 1. Technical guidance in the Central Fishery District in 2016.

| County | Name of lake / <br> pond owner | Date <br> sampled | Findings | Recommendations |

|  | Thomas Hughes | 8/2/16 | Good fish populations | Add cover |
| Spencer <br> (1) | Joseph Ansert | 8/8/16 | Unbalanced fish populations | Remove white bass and CCF |
| Washington (1) | Kathy Fresard | 8/24/16 | Unbalanced fish populations | Stock LMB; remove CCF |

## NORTHEASTERN FISHERY DISTRICT

Project B: Technical Guidance

## FINDINGS

Table 1 provides a list of ponds visited (16) in 2016 and our findings and recommendations. In addition to on-site inspections, consultations were rendered via telephone (75-100) and/or written correspondence (4). Most vegetation problems and a few population problems were resolved using email pictures, pond harvest log data or the use of the "Managing Your Farm Ponds" web page. Technical guidance was provided to individuals from all counties in the NEFD. Typical problems responded to include: pond stocking, aquatic vegetation problems, undesirable species, fishing information, fish kills, farm pond management, fish pathogens, water quality, pond construction, structural problems with dams, and pond nuisances.

| County | Name | Date | Findings | Recommendations |
| :---: | :---: | :---: | :---: | :---: |
| Bath | A. Brew er | 1-Sep | Vegetation problem | Apply CuSO4 to algae and Rodeo to shoreline undesirables |
| Clark | Winchester <br> Reservoir | 9-May | Good overall catches on bg, re and Imb | Harvest a few Imb over 12" |
| Fleming | City of Flemingsburg | 6-May | P1- Balanced (New) <br> P-2 Few fish observed; (old) good location | P1- No change needed <br> P-2 Recommended as FINS lake |
|  | Park Lake | 25-Apr | Unbalanced; many small Imb | Impose reg change for harvest of small Imb and limit bg to 15 fish creel |
| Lew is | J. Redmond | 8-Sep | Unbalanced; low bg | Restrict bg harvest for 2 years and harvest 30-50 Imb |
| Madison | R. Minerich | 25-Oct | Unbalanced | Harvest 50 lmb and stock 75 bg per acre |
| Menifee | R. Coffey | 23-Aug | Undesirable species, low conductivity | Remove undesirables caught, do soil test |
| Morgan | J. Collett | 2016 | P-1 Unbalanced | P-1 stock 200 bg and perform soil test |
|  |  |  | P-2 Balanced (ow ner w anted re) | P-2 stock 75 re |
|  | C. Fredrick | 23-Aug | P-1 Unbalanced; low bg | $\mathrm{P}-1$ limit bg harvest; soil test |
|  |  |  | p-2 Balanced | $\mathrm{P}-2$ soil test |
|  |  |  | p-3 Balanced | $\mathrm{P}-3$ soil test |
| Pow ell | Officer Rice | 24-Aug | Low numbers collected, no legal sized LMB | Install 15 " on Imb w ith 15 fish creel on bg, stock if fish are available |
| Row an | C. Jones | 24-Oct | Unbalanced | Stock 25 4-6" Imb and do a soil test |
|  | Eagle Lake | 13-Apr | Low number of fish collected | Stock forage and impose 15 fish creel on bg, investigate if stock trout |

## SOUTHEASTERN FISHERY DISTRICT

## Project B: Technical Guidance

## FINDINGS

Details of the technical guidance provided during 2016 are shown in Table 1. Technical guidance was provided through seven on-site visits. Additional technical guidance requests were handled over the telephone, or by written correspondence. Topics encountered and responded to included: fish population balance, water quality problems, fish disease, fish stocking, and aquatic vegetation problems.

Several other requests for information (approximately 200) about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone.

Table 1. Technical guidance provided in the Southeastern Fishery District during 2016.

| County | Name of pond or pond owner | Date | Findings | Recommendations |
| :---: | :---: | :---: | :---: | :---: |
| Bell | Appalachian Wildlife Center | 11/10 | Pond 1 (Visitor Center): mostly balanced fish population, maybe some crowding of the bass; chara and pondweed present | Pond 1: Add woody cover; add lime; add gravel |
|  |  |  | Pond 2: Balanced fish population | Pond 2: Add cover; add lime; continue current fish management |
| Casey | Bradley Clark | 6/3 | Bass slightly overcrowded; cattails present | Remove skinny bass; add lime; consider adding fertilizer in the spring; add woody cover; treat cattails with glyphosate |
| Knox | Pat Bacon | 8/17 | American pond weed and chara present | Stock 25-30 grass carp or spot treat vegetation with Clipper \& copper sulfate |
| Laurel | Corey Henson | 8/30 | Bass slightly crowded; pondweed and blue green algae present | Remove skinny bass; add lime; add cover; consider aeration |
| Pulaski | Donna Hall | 8/4 | Muddy water | Add hay, lime, gypsum, or alum |
|  | Betty Wooten | 8/16 | Watershield present | Treat watershield with Glyphomate 41 |
| Whitley | Danny Parks | 7/27 | Slightly overcrowded bass population | Remove 8-12 skinny bass; stock 15-20 4-6 inch bluegill; add lime; add woody cover |

# EASTERN FISHERY DISTRICT 

Project B: Technical Guidance

## FINDINGS

Details of the technical guidance provided during 2016 are shown in Table 1. Technical guidance (33) was provided by on-site visits (2), over the telephone, or by written correspondence. Topics encountered and responded to included: fish population balance, water quality problems, fish disease, fish stocking, and aquatic vegetation problems.

Several other requests for information about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone.

Table 1. Pond technical guidance in the Eastern Fishery District during 2016.

| Date | County | Owner | Problem | Recommendations |
| :---: | :---: | :---: | :---: | :---: |
| 3/28 | Floyd | Lenard Hall | fish stocking | Private Delers List |
| 3/28 | Martin | Ted McGinnis | grass carp | Remove |
| 4/5 | Martin | NA | pond balance, lilly pads | fish balance is okay, herbicide |
| 4/6 | Knott | Blake Smith | red spotted new ts | UK extension office |
| 4/11 | Harlan | Eric Creech | pond stocking | NRCS, KDFWR pond book, private dealer list |
| 4/14 | Law rence | Roland Gray Jr. | pond color | mix pond w ater w ith other pond |
| 4/19 | Harlan | C.V. Bennett | pond stocking | private dealer list, KDFWR pond book |
| 4/18 | Martin | Danny Mooney | fish dying from bacteria | salt, copper sulfate |
| 4/25 | Magoffin | Tim L Carty | pond stocking | private dealer list |
| 5/3 | Martin | E.J. Horn | beaver problems | KDFWR pond w ebsite link |
| 5/17 | Law rence | Kim LeMaster | w atershield \& fish stocking | ShoreKlear \& private dealer list |
| 5/20 | Pike | Ravenrock Golf Course | vegetation | grass carp |
| 5/20 | Floyd | Stone Crest | pond balance, stocking | grass carp |
| 5/26 | Boyd | Josh Preston | fish dying | reduce stocking rate, no aquashade, add lime |
| 5/31 | Magoffin | Don Lykins | pond re-stocking | check pond balance via fishing, KDFWR pond book |
| 6/8 | Martin | Steve Cox | w atershield | ShoreKlear-Plus |
| 6/13 | Magoffin | Donnie Patrick | vegetation | lime, herbicide, Cutrine-Plus \& Rew ard |
| 6/13 | Floyd | Eugene | vegetation | Cutrine-Plus |
| 6/14 | Johnson | Diana+Dean How ard | filamentous algae | Cutrine-Plus |
| 7/12 | Pike | Travis Hall | fish dying | harvest fish, aerate, copper sulfate |
| *7/15 | Pike | Travis Hall | fish dying | stop use of copper sulfate |
| 7/18 | Leslie | Vicki Wooton | stocking | private dealer list |
| 7/19 | Perry | Alice Ritchie | paylake carp removal | stop releasing carp into Lotts Crk, alternative removal |
| 7/20 | Knott | Dexter Conley | stocking | private dealer list |
| 7/25 | Pike | Jordan Thacker | pond stocking | KDFWR w ebsite link, private dealer list |
| 7/26 | Floyd* | Don Lowe | duckw eed, naiad | Rew ard w ith surfactant |
| 8/18 | Martin* | Anita Preece | w atermill, dead fish | Cutrine-Plus, Weedtrine, lime, private dealer list |
| 8/25 | Law rence | Evan Young | pond balance | do not harvest bass 13-19", lime |
| 8/8 | Law rence | Denzil Hall | stocking | private dealer list |
| 11/6 | Knott | McClain Drive | brazilian elodea | grass carp |
| 11/28 | Letcher | Elis Keyes | pond stocking | private dealer list, KDFWR pond book |
| *11/04 | Letcher | Chad Morgan | pond bal, stocking | Stock RE sunfish, harvest small bass, add habitat |
| 12/12 | Knott | Bob Stew art | new pond stocking | private dealer list, KDFWR pond book |

[^43]Project B: Fish Habitat Improvement - Public Lakes Fertilization

| Lake |  | County | Size (acres) |
| :--- | :--- | :--- | ---: |
| Southwestern Fishery District | Subtotal |  | 204 |
| Marion County Lake |  | Marion | 25 |
| Spurlington Lake | Taylor | 25 |  |
| Briggs Lake | Logan | 18 |  |
| Shanty Hollow Lake | Warren | 136 |  |
|  |  |  |  |
| Eastern Fishery District | Subtotal |  | 37.5 |
| Fishpond Lake |  | Knott | 30.3 |
| High Splint Lake | Harlan | 6.9 |  |
| Elkhorn Park Lake |  | Floyd | 0.3 |

## Project B: Fish Habitat Improvement - Fish Attractors

| District / Lake | Fish Attractor Sites |
| :---: | :---: |
| Western Fishery District |  |
| Barkley Lake | 35 Christmas tree units were used to create new fish attractor sites; 6 Christmas tree units were used to refurbish existing deepwater fish attractors |
| Kentucky Lake | 42 hardwood units ( 1 tree=1 unit) were used to create new deep water fish attractor sites; 172 hardwood units were used to refurbish existing deepwater sites; 106 Christmas tree units ( 2 trees $=1$ unit) were used to create new attractor sites; 118 Christmas tree units were refurbished on old sites; 16 new shallow water Christmas tree units were created; 268 hardwood stake beds were refurbished and 6 new sites were created |
| Northwestern Fishery District |  |
| Peabody WMA Lakes |  |
| Musky Lake | 3 cluster palm gas line attractors |
| Nolin River Lake |  |
| Moutardier area | 44 mature flood killed cedar trees |
| Wax area | 52 "spider block square" gas line attractors |
| Dog Creek | 52 gas line attractors ("cattails" and "snags") |
| Rough River Lake |  |
| Little Clifty Creek area | 19 gas line attractors (various designs) |
| Cave Creek area | 245 gas line attractors ("cattails" and "snags") |
| Peter Cave Creek area | 163 "snag" gas line attractors |
| Kingfisher lakes |  |
| New Kingfisher | 5 spider block and 5 cluster palm gas line attractors |
| Southwestern Fishery District |  |
| Barren River Lake | 2 new brush sites, 11 refurbished brush sites, 1 new stake bed |
| Green River Lake | 5 new brush sites, 1 refurbished brush site, 2 new pallet trees sites |
| Briggs Lake | 2 refurbished brush sites, 4 brush piles |
| Shanty Hollow Lake | 4 new brush piles, 2 refurbished brush piles |
| Mill Creek Lake | 1 new brush site, 1 new pallet tree site |
| Metcalfe County Lake | 1 new stake bed, 1 refurbished brush pile |
| Three Springs Lake | 2 refurbished brush sites, 1 new brush sites |

Project B: Fish Habitat Improvement - Fish Attractors cont.

| District / Lake | Fish Attractor Sites |
| :---: | :---: |
| Central Fishery District |  |
| Elmer Davis Lake | 101 PVC structures (spider ball); 80 brush piles ( 633 trees); 106 pallet structures (3 pallets per unit + 2 trees per pallet (200 trees); 3 stake beds; 2 hinge cut (fallen trees) |
| Taylorsville Lake | 18 hinge cut (fallen trees); 8 brush piles (575 total trees) |
| Northeastern Fishery District |  |
| Cave Run Lake |  |
| Annual habitat work | 2 refurbished brush sites (Christmas tree sites - 100+ trees) |
| Large-scale habitat project work | Ramey's Creek and Warix Run sites: In total, 10 new sites were created. Over 1,000 units of structure added to the lake including: Christmas tree bundles, larger cedar trees, pallet structures, stake buckets, plastic pallet structures, concrete culverts, hardwood tree stumps and wooden spool structures |
| Grayson Lake | 4 refurbished brush sites (Christmas tree sites - 150+ trees) |
| Southeastern Fishery District |  |
| Laurel River Lake | 10 brush sites refurbished (30 Christmas trees per site) |
| Eastern Fishery District |  |
| Buckhorn Lake | 11 new pallet structures with christmas trees; 450lbs of winter wheat sowed |
| Carr Creek Lake | 37 new pallet structures with christmas trees and hardwood |
| Dewey Lake | 4 new brushpiles; 8 refurbished brushpiles; 3 new christmas tree reefs; 6 hinge-cut trees; 2 refurbished stake beds; 5 new stake beds with christmas trees; sago pondweed planted |
| Fishtrap Lake | 1 new big brush pile christmas trees hardwood drift |
| Martin County Lake (Milo) | 8 new brushpiles christmas trees with hardwood drift stakes |
| Paintsville Lake | 10 new brushpiles |
| Yatesville Lake | 2 refurbished brushpiles; 1 refurbished christmas tree reef; 14 hingecut trees; 6 new brush piles; 3 new chritmas tree reefs (approximately 300 trees) |
