# WESTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Sampling conditions for each survey event are listed in Table 1.

## Kentucky Lake

During the spring, 1,424 black bass were collected by diurnal electrofishing ( 120 PPS, DC current). During this sampling period, 1,363 largemouth bass ( 136.3 fish $/ \mathrm{hr}$ ) were collected from Blood River, Jonathan Creek, Big Bear, and Sugar Bay (Table 2). The catch rates (fish/hr) for largemouth bass between embayments varied ( 98.0 to 175.6 fish $/ \mathrm{hr}$ ). This variation could be due to changing weather conditions during the sampling period. The main similarity between embayments was that each one yielded a high catch rate of largemouth bass ( $<$ 8.0 in ).

The spring bass data was used to complete the lake specific assessment (Table 3). The lake specific assessment suggests that the largemouth bass population rated "Good". The growth rate parameter was determined with age data collected in the fall, but back-calculated to spring growth. Growth to age 3 declined by almost a half an inch since 2012 and may be best explained by the higher density of intermediate-size bass in the population during 2016. Growth will be reassessed in 2019. The catch rate of age-1 largemouth bass in the sample was very high, and received a rating of "excellent".

The size structure parameters used to assess the fishery by standards set in the Kentucky Lake Fish Management Plan (KLFMP) showed a major increase of smaller ( $<8.0 \mathrm{in}$ ) bass (Table 4). The catch rate of intermediate-size bass (12.0-14.9 in) which was ( $14.1 \mathrm{fish} / \mathrm{hr}$ ) was below the plan recommendation. The catch rate of harvestable-size bass ( $\geq 15.0 \mathrm{in}$ ) was also down from previous years' data, and below the plan recommendation. The catch rate of trophy-size largemouth bass ( $\geq 20.0$ in) improved over the previous year, but was below the KLFMP recommendation.

Proportional Size Distributions (PSD) values were calculated for black bass collected from each embayment sampled during the spring (Table 5). The average PSD and $\mathrm{RSD}_{15}$ values for largemouth bass were 43 and 23 , respectively. These average values were used in the KLFMP assessment. The PSD value was below the assessment preferred range (55-75; Table 4). The $\operatorname{RSD}_{15}$ value was 23 , which falls inside the targeted range ( $\operatorname{RSD}_{15}$ of 20-40). Both of these values were influenced heavily by the unusually high catch of largemouth bass ( $<8.0 \mathrm{in}$ ).

During October, 341 black bass were collected by diurnal electrofishing ( 120 PPS, DC current) from two embayments; Blood River and Big Bear. Largemouth bass comprised $80 \%$ ( $50.2 \mathrm{fish} / \mathrm{hr}$ ) of this sample (Table 6). During the 2016 fall sample, the largemouth bass catch rate was 76.4 fish $/ \mathrm{hr}$. In the 2017 sample there was a below average catch ( 28.9 fish/hour) of the age 0 -year class (Table 7).

Length and weight data were recorded from all bass collected during the fall sample to calculate relative weight values. The mean relative weight for harvestable-size largemouth bass was 88 (Table 8). This value was down from the 2016 estimated relative weight value of 98 , though the 30 -year average is 96 . The relative weight of largemouth bass is one parameter that is being watched as an indicator of the increasing population of Asian carp in the lake. As Asian carp numbers continue to increase, they could impact the productivity of the lake and hence the food chain. The relative weight score of 88 is concerning, as it is the lowest score ever observed in Kentucky Lake.

Length-weight equations for black bass species at Kentucky Lake are:

Largemouth bass
Smallmouth bass
$\log _{10}($ weight $)=-3.36695+3.01733 \times \log _{10}($ length $)$
$\log _{10}($ weight $)=-3.38276+3.02400 \times \log _{10}($ length $)$

Otoliths were collected from largemouth bass during fall sampling in 2017. Otoliths were used to age bass so that the catch rates of age classes and growth could be evaluated. The catch rate of age-0 largemouth bass during the fall sample was 28.9 fish $/ \mathrm{hr}$ (Table 7). The 2017 year class appears to be slightly below average, with good growth. The mean length of the age- 0 largemouth bass was 5.9 in at time of capture in the fall. The high catch rate of age-1 largemouth bass observed in the spring was not evident in the fall sampling ( $9.1 \mathrm{fish} / \mathrm{hr}$ ) (Table 9).

In response to questions about potential harvest restrictions, targeted electrofishing for bluegill and redear sunfish ( $120 \mathrm{pps}, 6-8 \mathrm{amps}$ ) was conducted in Blood River and Ledbetter Creek during May 2017 (Table 10). Otoliths were removed from a subsample of fish to reveal growth patterns and age distributions. Bluegill were observed up to age-7, although growth slowed considerably after age-3 (Table 11). Redear sunfish were observed up to age-11 (Table 12). Growth up to age-3 is fast ( 8.5 in ), but slows greatly after that point.

Otoliths were also removed from a subsample of bluegill and redear sunfish collected during fall trapnetting for crappie in October and November at Blood River, Jonathan Creek, and Ledbetter Bay. Although growth rates were very similar in both species, a wider range of age classes was observed from spring samples (Tables 11 and 12).

Trap nets were fished for crappie in Blood River and Jonathan Creek embayments for 78 net-nights (nn) during October and November. In addition, Ledbetter Bay was sampled for 40 nn . This is the second time Ledbetter Bay has been sampled for crappie. The combined sampling effort yielded 1,165 crappie ( 9.9 fish $/ \mathrm{nn}$ ), of which 2.7 fish $/ \mathrm{nn}(27 \%)$ were white crappie and 7.2 fish $/ \mathrm{nn}$ ( $73 \%$ ) were black crappie (Table 13). The Blood River and Jonathan Creek data is listed as "sub-total" on this table. The total catch rate was lower this year as compared to previous years. The weak spawn of 2016 as predicted by larval surveys was supported by a very low catch of age 1 crappie in the trapnets (Table 14).

The number of crappie $\geq 8.0$ in and $\geq 10.0$ in collected in trap nets was 10.6 and 2.4 fish $/ \mathrm{nn}$, respectively (Table 14). The KLFMP objective for crappie is to maintain a catch rate of at least 10.0 fish $/ \mathrm{nn}$ for crappie $\geq 8.0$ in, and $4.0 \mathrm{fish} / \mathrm{nn}$ for crappie $\geq 10.0 \mathrm{in}$. The first objective was met, but trapnets failed to collect $>4.0 \mathrm{fish} / \mathrm{nn}>10.0 \mathrm{in}$. Based on creel survey results we would have expected higher catch rates of keeper-size fish.

Crappie at Kentucky Lake had below average growth rates in 2017. The growth management objective in the KLFMP is for age- 2 crappie collected in the fall to reach 9.5 inches in length. The average length of the age- 2 crappie collected this year was 8.9 in (Table 14). This is likely due to high densities of intermediate-sized crappie, but could also be due to lower numbers of prey such as shad.

Another management objective in the KLFMP is to maintain a catch rate of age-1 crappie of at least 11.0 fish $/ \mathrm{nn}$ (Table 14). The catch rate for this age group of crappie was 1.5 fish $/ \mathrm{nn}$. This is the lowest catch rate ever recorded at Kentucky Lake and indicates a very poor spawn in 2016.

These parameters are also used as part of the calculation for ranking the crappie fishery at Kentucky Lake. Overall, the crappie population at Kentucky Lake rated "poor" this year (Table 15). This rating is assumed not to be an accurate portrayal of the crappie population since the catch rates observed in the creel survey were exceptional.

The fall trap netting data was used to calculate proportional size distributions and length-weight equations for crappie. PSD and $\mathrm{RSD}_{10}$ values are reported in Table 16. The PSD values are up considerably, and reflect a higher number of intermediate-size crappie in the population from a good year class in 2015. However, $\mathrm{RSD}_{10}$ values were down reflecting the poor catch of keeper size crappie in the trapnets. Length-weight equations for white and black crappie are listed below. Growth is similar to last year's growth.
$\begin{array}{ll}\text { White crappie } & \log _{10}(\text { weight })=-3.85398+3.51686 \times \log _{10} \text { (length) } \\ \text { Black crappie } & \log _{10}(\text { weight })=-3.47727+3.17408 \times \log _{10} \text { (length) }\end{array}$

Tables 17 and 18 list the back-calculated lengths at age for white and black crappie, respectively. The age frequencies for white and black crappie collected are listed in Tables 19 and 20, respectively.

During the spring of 2017, icthyoplankton sampling was conducted in the Jonathan Creek embayment of Kentucky Lake. Samples were conducted using a rectangular neuston net with a 100 -micron mesh size, towed 50 feet behind a boat, at a speed of 1.5 mph . Tow duration was either 5 or 3 minutes depending on an a priori assessment of the expected concentration of icthyoplankton and leptodora to prevent clogging. A General Oceanics flowmeter was attached inside the mouth of the net to record the volume of water sampled during each run. Sampling was begun just after dusk and always followed the same site order. Each sampling event started closest to the main lake site and then progressed farther into the embayment (Appendix A).

Samples were preserved immediately in $10 \%$ formalin or $95 \%$ ethanol and stored in mason jars. All larval fish were sorted and identified to the lowest practical taxon using "A Practical Key to Identify Families, Genera, and Species of Fish Larvae Commonly Collected in Tennessee Reservoirs" (Sammons, 1999); "Preliminary Guide to the Identification of Larval Fishes in the Tennessee River" (TVA, 1976); and "Early Development of Four Cyprinids Native to the Yangtze River, China" (Chapman, and Wang, 2006) (Bolu Yi, et al. 1988). Once identified, fish were counted and measured for total length. In cases of more than 100 individuals in a sample, a random subsample of at least 30 individuals was measured and used to extrapolate the lengths of the fish from the entire sample. Larval crappies were not identified to species due to overlapping myomere counts between both species and their hybrids (Spier and Ackerson, 2004).

The geometric mean and median of the 6 sample sites were used to evaluate overall densities during each week. The standard error and coefficients of variation of the mean and geometric mean were used to evaluate sample accuracy (Table 21). In 2015 the peak weekly density of crappie occurred on May $12^{\text {th }}$ and was 70.50 crappie $/ 1000 \mathrm{~m}^{3}$. In 2016 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was only 3.88 crappie $/ 1000 \mathrm{~m}^{3}$. In 2017 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was 31.99 crappie $/ 1000 \mathrm{~m}^{3}$. Based on these results, the spawn of crappie in Jonathan Creek in 2017 appears to have been somewhat better than 2016, but not as good as 2015. This will still need to be verified with trap netting in 2018.

In order to determine the hatch dates of crappies more precisely, based on growth rates, all crappie that were $8-11 \mathrm{~mm}$ in total length were assumed to represent a one-week cohort (Table 22). Just like last year, crappie in the $8-11 \mathrm{~mm}$ range appeared to be fully recruited to the gear, and were well represented in the sample. It is possible that crappie shorter than 8 mm were not located in the pelagic sample sites yet, and that crappie over 11 mm were more likely to avoid capture. This length range was also chosen because an 8 mm crappie would grow to 11.8 mm in one week (our sample interval), based on a growth rate of 0.65 mm per day after swim up. This was our estimated daily growth rate from daily otolith ring counts of Jonathan Creek crappie collected later in the year (next section)

In addition to weekly cohorts, we also estimated daily cohorts of hatched crappie. All crappie that were captured outside of the $8-11 \mathrm{~mm}$ length range were excluded from the hatch date analysis to minimize the effects of gear bias and the longer exposure to natural mortality of older fish (Table 21). A hatch date was then backcalculated for each individual fish using the assumed growth rate $(0.66 \mathrm{~mm} /$ day $)$ and the total length of each fish. A total length at hatch ( 4 mm ) was factored into the regression for hatch date. This technique has been employed in other systems (Mitzner 1991). An incubation period of 95 hours (based on temperature) was also factored into the regression so that the day when fertilization occurred could be estimated.

The estimated hatching densities indicated that the spawn in Jonathan Creek lasted at least 44 days and extended at least until the end of May (Table 23). Because of our limited larval sampling window, we cannot be sure that crappie did not spawn before or after our sampling window. The literature reports most crappie spawns to be relatively short (1-2 months; Mitzner 1991 and Travnichek, et. al.1996). No strong peaks in successful spawning activity were observed. 2017 was a strange year with regard to elevation. The lake was up to summer pool (359.0) by 23-April and some spawning activity was occuring, but the lake was then rapidly lowered 2 feet in anticipation of a flood event. The highest numbers of crappie spawning occurred when the lake was rising rapidly (May-3) and during the flood event when the lake reached 363.1. A previous study evaluating the factors which affect crappie recruitment in Kentucky Lake found that higher discharge during the spawn and pre-spawn were correlated with good year classes of white crappie. However, black crappie were more likely to be successful during years with relatively low discharge during the spawn and pre-spawn (Martin, 2012). Unfortunately, we cannot tell from larval data which species had the stronger spawn, but it will be interesting to see whether the class of 2017 for each species
will be well represented in our trap net samples in 2018. Similar to last year's survey we found much higher densities of larval crappie farther into the embayment (Table 21; Appendix A).

The catfish population was sampled at Kentucky Lake during June by using low pulse (15 PPS) electrofishing along the main lake river channel. A chase boat was utilized to help collect catfish around the electrofishing boat. One dipper was used in each boat. A total of 137 catfish were collected during the 56 electrofishing runs made (Table 24). Each run lasted 300 seconds, for a total sample time of 4.6 hours over a fourday period. Of the samples, blue catfish had the highest catch rate at 23.9 fish $/ \mathrm{hr}$, and made up $81 \%$ of the catfish collected. The catch rate was much lower than observed in previous years. Relative weight values are listed in Table 25. The relative weight values are all high, suggesting the fish are healthy.

Otoliths were collected during sampling in 2014. That data was used to extrapolate with this year's data to calculate age frequencies. Age frequency data for blue catfish is presented in Table 26. A high catch rate of age-3 blue catfish collected in 2016 did equate to a higher catch rate of age 4 in 2017.

A new catfish surveying technique was also evaluated in 2017. The goal of the new technique was to use camera technology to increase the sample size while reducing the number of staff needed for the sample. On two of the sample dates, we recorded our electrofishing runs using an aerial drone equipped with a 4 K video camera. The video was then reviewed and the lengths of collected catfish were measured digitally using image analysis software (ImageJ) The digitally derived lengths were then compared with actual measured lengths to determine the efficacy of the method. Video observations were also analyzed to determine species ID as well as capture efficiency rates. Although we were able to determine fish length and determine sampling efficiency, we were unable to visually identify catfish to species using the video footage. This technique may be revisited as camera technology improves.

## Lake Barkley

Black bass were collected by diurnal electrofishing (120 PPS, DC current) during the spring at sampling sites historically used on Lake Barkley. A total of 663 black bass were collected at a rate of 69.8 fish $/ \mathrm{hr}$ (Table 27). Spotted and smallmouth bass accounted for about $4 \%$ of the total black bass sampled. The catch rates improved slightly over last year, but were still below the long term average. At best, it was felt that sampling yielded only fair results. Although sampling during some years $(2011,2012,2016)$ was believed to be affected by weather conditions, the lack of a strong spawn between 2009 and 2016 has likely reduced the overall numbers of bass in Lake Barkley. This might explain the drop in intermediate-size bass during the most recent study. The largemouth bass catch rate was 67.2 fish $/ \mathrm{hr}$ which falls below the ten-year average of $92.1 \mathrm{fish} / \mathrm{hr}$ (Table 28).

The overall PSD and $\mathrm{RSD}_{15}$ values for largemouth bass at Lake Barkley, along with values for individual embayments are listed in Table 29. The PSD value (76) is slightly above the objective goal (PSD of 55-75) established in the Barkley Lake Fish Management Plan (BLFMP). This higher value indicates a bass fishery slightly skewed toward larger fish. The $\operatorname{RSD}_{15}$ (56) was also higher than the set goal (20-40). Again, the higher the value the more the population is skewed toward larger fish. The spring catch of small ( $\leq 8.0 \mathrm{in}$ ) largemouth bass improved this year due to the spawn of 2016, but the catch rate of (8.0-11.9 in) largemouth bass remains lower than average (Table 27). The catch rate of larger ( $\geq 15.0 \mathrm{in}$ ) largemouth bass was average.

The lake specific assessment score for Lake Barkley was "good" (Table 30). The score was "good" for several years prior to 2010. Flood conditions in 2010, 2011, and 2013 as well as drought conditions in 2012 likely influenced sampling resulting in spurious lower ratings for these years. The fishery showed improvement in these ratings in 2017, but the low catch rate of (12.0-14.9 in) largemouth bass still negatively affected the score. The annual mortality of largemouth bass older than a year was $28 \%$ as determined using catch-curve regression of fall caught largemouth (Table 30).

During 2015 largemouth bass age and growth data was collected in the fall instead of the spring. This statewide change in sampling procedure was made to simplify the reading of otoliths by eliminating the need to add an unseen annulus onto the outer edge. Age and growth data collected in the fall of 2015 were coupled with spring 2017 data to yield an estimate of the age distribution for largemouth bass which was historically comparable with previous spring samples. This was accomplished by back calculating the lengths of fall captured largemouth bass to their most recent annulus. These back calculated lengths were assumed to be equivalent to lengths of spring caught bass and were used to create a modified age-length key.

Catch rates for spring-caught fish by age-class are shown in Table 31. Ages ranged from 0-11 and the dominant age-class was age-1. Slightly higher catch rates of age- 5 and age-7 bass were also observed.

Largemouth bass were sampled in October to collect length-weight data for condition factors, and to determine the strength of the 2017 year-class. A total of 271 bass were collected, with $88 \%$ being largemouth bass (Table 32). Largemouth bass had a catch rate of $53.1 \mathrm{fish} / \mathrm{hr}$. These catch rates were much lower than previous years. Sampling conditions likely affected these rates as it was unseasonably warm and excessive rainfall greatly affected water clarity. Relative weights were determined for all bass, but very few spotted and smallmouth bass were collected (Table 33). The relative weight for harvestable-size ( $\geq 15.0 \mathrm{in}$ ) largemouth bass was 97 . The lengthweight equation for largemouth bass at Lake Barkley is:

$$
\log _{10}(\text { weight })=-3.56676+3.24024 \times \log _{10}(\text { length })
$$

Mean length of the age- 0 cohort of largemouth bass was 4.8 in (Table 34). It has been suggested that bass which reach at least 5.0 in by the fall will have a better chance of survival during their first winter. This year's catch rate of age-0 largemouth bass ( $25.1 \mathrm{fish} / \mathrm{hr}$ ) was below average.

In response to questions about potential harvest restrictions, targeted electrofishing for bluegill and redear sunfish ( $120 \mathrm{pps}, 6-8 \mathrm{amps}$ ) was conducted at Devil's Elbow and Ford's Bay during May 2017. Otoliths were removed from a subsample of fish to reveal growth patterns and age distributions. Bluegill were observed up to age3 and reached an average of 6.9 in (Table 35). Redear sunfish were observed up to age-9 and reached an average
length of 12.3 in at that age (Table 36). Redear sunfish growth up to age-3 is fast ( 9.3 in ), but slows greatly after that point.

Otoliths were also removed from a subsample of bluegill and redear sunfish collected during fall trapnetting for crappie in October and November at Little River, Donaldson Creek, Crooked Creek, and Eddy Bay. Growth rates and age ranges were similar between both spring and fall samples (Tables 35 and 36).

Trap nets were fished for crappie in Little River and Donaldson Creek embayments for 79 net-nights (nn) during October and November. A total of 858 crappie were collected at a rate of $11.0 \mathrm{fish} / \mathrm{nn}$ (Table 37). Additionally, Crooked Creek (LBL) ( 40 nn ) and Eddy Creek ( 30 nn ) were sampled for total of 70 net nights. Both Crooked Creek and Eddy Creek provided a good sample ( 10.6 fish $/ \mathrm{nn}$ ), and will be sampled again in the future if possible.

White crappie and black crappie each accounted for $50 \%$ of the total catch, and were collected at a rate of 4.2 fish/nn (Table 37). Donaldson Creek contained higher proportions of black crappie than Little River, Crooked Creek, and Eddy Creek (Table 37). For historical comparisons, only data from Little River and Donaldson Creek were used in the standardized population parameters of Lake Barkley crappie in Table 38. The catch rate of harvestable-size ( $\geq 10.0 \mathrm{in}$ ) crappie was slightly lower than the ten-year average at 1.7 fish $/ \mathrm{nn}$. The catch rate of quality-size ( $\geq 8.0 \mathrm{in}$ ) crappie was 2.4 fish $/ \mathrm{nn}$, which is below the management objective ( 4.0 fish $/ \mathrm{nn}$ ) set in the BLFMP. The catch rate of age-1 crappie ( 1.7 fish $/ \mathrm{nn}$ ) was well below the management objective ( 5.0 fish $/ \mathrm{nn}$ ).

The length-weight equations of white and black crappie from Lake Barkley are:

$$
\begin{array}{ll}
\text { White crappie } & \log _{10}(\text { weight })=-3.60596+3.29961 \times \log _{10} \text { (length) } \\
\text { Black crappie } & \log _{10}(\text { weight })=-3.62045+3.36207 \times \log _{10} \text { (length) }
\end{array}
$$

Otoliths from 355 crappie were used for age and growth analysis. Ages ranged from 0-7 years for white crappie and $0-4$ years for black crappie (Tables 40 and 41). Growth continues to be good as crappie reached 10.0 in between age 2 and 3. The average lengths of age $2+$ white crappie and black crappie at capture were 11.2 in and 9.9 in, respectively (Table 38). Crappie collected in trap nets were used to determine stock densities. The PSD (65) and $\mathrm{RSD}_{10}$ (22) of white crappie were identical to the 2016 sample (Table 39). The PSD (47) and $\mathrm{RSD}_{10}$ (11) values of black crappie were also identical to last year, and suggests a balanced size distribution of black crappie.

Length at age results for both species are given in Tables 42 and 43. Age frequencies were estimated by combining catch data with age data. The catch of white crappie was dominated by age- 0 fish suggesting an average year class in 2017 and a weak year class in 2016 (Table 42). Very few white crappie older than age-2 were collected which was unexpected due to the strong spawn in 2014. Black crappie ages in Little River and Donaldson Creek were also dominated by age 0 fish, suggesting at least an average spawn in 2017 and a weak 2016 spawn (Table 43).

Assessment of the crappie population yielded a rating of "Fair" at Lake Barkley in 2017 (Table 44). The catch of age- 1 crappie was down from 2016 data, however, catches of age- 0 were above average. The growth rate rankings improved slightly. As time goes on and the year class of 2014 succumbs to fishing and natural mortality, we expect the population of crappie to drop in response to the poor year class of 2016.

The catfish population was sampled at Lake Barkley during June by using low pulse (15 PPS) boat electrofishing with one dipper along the main lake river channel. A chase boat with one dipper was also utilized to help collect catfish around the electrofishing boat for a total of two dippers. A total of 1177 catfish were collected during the 68 electrofishing runs made (Table 45). Each run lasted 300 seconds, for a total sample time of 5.7 hours over a four-day period. Of the sample, blue catfish had the highest catch rate at $183.3 \mathrm{fish} / \mathrm{hr}$, and made up $88 \%$ of the catfish collected. Flathead catfish and channel catfish are likely underrepresented using this method as these fish were often observed, but were much harder to approach and dip than blue catfish. Relative weight values were near the ideal values of 100 and are listed in Table 46. The aerial drone sampling technique was also utilized at Lake Barkley. See the Kentucky Lake catfish section for methods.

Age data from catfish collected in 2014 was used to calculate an age frequency for catfish collected during 2016. Age frequency data is presented in Tables 47 and 48 for blue catfish and channel catfish, respectively. These
tables should be used with caution as some larger size classes were unrepresented in 2014, and were therefore excluded from this age frequency data. Of the blue catfish, almost $82 \%$ of the sample consisted of age 1-3 fish.

## Kentucky Lake Creel Survey

A random, non-uniform probability, roving creel survey was conducted on the Kentucky portion (51,000 a) of Kentucky Lake from 16 February to 30 November 2017. The Kentucky portion of the lake was divided into ten creel areas (Appendix B). The survey was conducted five days per week, six hours per day. One hour each day was randomly chosen to conduct an angler count. The remaining five hours was dedicated to creeling anglers actively fishing. The overall temporal sampling scheme was twenty days per month, consisting of six weekend days and fourteen weekdays. Varying time period probabilities were assigned to each month. Higher geographic probabilities, resulting in more frequent interviews, were assigned to the Blood River and Jonathan Creek areas from March through May, and October and November, than were assigned to the other six areas. Equal probabilities were assigned to all areas from June to September. An angler attitude questionnaire concerning fishing on Kentucky Lake was conducted by the creel clerk throughout the survey period (Appendix C).

During the 2017 creel, the typical angler was a male (91\%) resident (58\%) who was casting (48\%) or still fishing ( $20 \%$ ) from a boat ( $92 \%$; Table 49). Of the crappie anglers, $51 \%$ used a spider rig (defined as 3 or more poles per angler) for fishing. The average fishing trip for all anglers was 4.9 hours. There was a decline in the number of trips of $(173,145)$. This is the lowest number of trips ever recorded in a Kentucky Lake creel survey, but only represents an $8 \%$ decrease since 2015. Despite a low number of trips, anglers caught an above average number of fish $(1,370,520)$. Length frequencies of all harvested or released fish are given in Table 50.

Table 51 provides fish catch and harvest statistics for the 2017 creel survey. Crappie anglers accounted for $33 \%$ of fishing trips to Kentucky Lake in 2017 ( $33 \%$ in 2015, $24 \%$ in 2011; Table 51). Estimated catch and harvest rates for crappie were well above average. Crappie anglers caught ( $2.41 \mathrm{fish} / \mathrm{hr}$ ) which is well above the long-term average of ( $1.12 \mathrm{fish} / \mathrm{hr}$ ). However, of the crappie caught, $68 \%$ were under harvestable size (Table 52). This higher proportion of sublegal-size crappie corresponds to fall trap netting data that suggest good year classes in 2014 and 2015. 68\% of the crappie were caught in February and April (Table 53). As part of our efforts to evaluate harvest by method, crappie anglers were recorded as using the following methods: casting, still fishing (1-2 poles), spider rigging ( 3 poles), spider rigging ( $4-5$ poles), spider rigging ( $>5$ poles). During this survey, $51 \%$ of crappie anglers used 3 or more poles. The percentage of crappie anglers using ( $>5$ poles) increased to $26 \%$ in 2017 compared to only $15 \%$ of crappie anglers in 2015 (Table 54).

Black bass anglers accounted for $42 \%$ of all fishing trips to Kentucky Lake during 2017 (Table 51). There were 72,325 black bass fishing trips in the 2017 creel, which is slightly below the long-term average for Kentucky Lake. During older surveys, any bass that was currently in the livewell was recorded as harvested. However, during recent surveys, anglers with bass in the livewell were asked if they intended to release them at the end of the day. In all cases, tournament anglers indicated that they intended to release their fish after the weigh-in. Additionally some non-tournament anglers simply chose to keep fish in the livewell for photographic or "mock tournament" purposes, but indicated that they would release them at the end of the day. As a comparison with previous surveys, bass kept in livewells by anglers were reported as harvested, even though they would be released at the end of the day. The harvest rate, which included tournament bass and "mock tournament" bass, was estimated to be 0.07 bass per hour for anglers actually targeting bass (Table 55). However, when tournament and "mock tournament" harvested bass were removed from the actual harvest, the harvest rate dropped to $0.009 \mathrm{bass} / \mathrm{hr}$. Largemouth bass accounted for $95 \%$ of the harvested black bass (Table 56).

About 6\% of all trips were taken to catch panfish during 2017 (Table 51). This value is low compared to recent surveys. In 2011, almost $21 \%$ of the trips taken targeted panfish. Likewise, catch and harvest rates were slightly below the long-term average. Almost $68 \%$ of the panfish were harvested during May (Table 57). Bluegill and redear sunfish accounted for $99 \%$ of the panfish harvested. Of the bluegill, only $52 \%$ of the fish caught were harvested, while $87 \%$ of the redear sunfish caught were harvested (Table 58).

Catfish anglers accounted for $8 \%$ of all fishing trips on Kentucky Lake in 2017 (Table 51). The number of trips for catfish was slightly below the long-term average, but was an increase from recent years. The catfish fishery remains highly harvest oriented. Almost $88 \%$ of the catfish caught were harvested (Table 59). Higher numbers of
catfish caught were reported in May (Table 59). These were likely anglers targeting channel catfish in the embayments. The total catch of channel catfish was more than double the catch of blue catfish (Table 60).

Only about $2 \%$ of the anglers fishing Kentucky Lake during 2017 sought Morones (Table 51). This group includes; white bass, yellow bass, striped bass and hybrids. However, it is likely that most anglers were fishing for white or yellow bass and incidentally caught some of these other species. Approximately $80 \%$ of the Morones caught were yellow bass, but white bass made up $40 \%$ of the Morones harvest. Almost $84 \%$ of yellow bass were released after being caught (Table 61). There were no reports of anglers targeting Morones in April, however an above average number of Morones were caught incidentally during that month (Table 61).

## Kentucky Lake Winter Creel Survey

A random uniform probability roving creel survey was conducted in Jonathan Creek, Blood River, and Big Bear embayments ( 32,217 acres) on Kentucky Lake from 01 December 2017 through 30 February 2018. The primary objective of the survey was to assess the wintertime crappie fishery. The survey was conducted 15 days per month, six hours per day. One hour each day was randomly chosen to conduct an angler count. The remaining five hours was dedicated to creeling anglers actively fishing. The overall temporal sampling scheme was 15 days per month, consisting of five weekend days and 10 weekdays. Varying time period probabilities were assigned to each month. Equal probabilities were assigned to all three areas. An angler attitude questionnaire concerning fishing on Kentucky Lake was conducted by the creel clerk throughout the survey period (Appendix C).

During the winter creel, the typical angler was a male ( $98 \%$ ) resident ( $94 \%$ ) who was crappie fishing with $>5$ poles $(67 \%)$ from a boat ( $96 \%$ ) (Table 63). These results suggest that the wintertime crappie fishery draws much fewer non-resident anglers than was observed throughout the warmer months. Of the crappie anglers, $90 \%$ used a spider rig (defined as 3 or more poles per angler) for fishing. The average fishing trip for all anglers was 3.9 hours. Length frequencies of all harvested or released fish are given in Table 64.

Table 65 provides fish catch and harvest statistics for the 2017-2018 winter creel survey. Crappie anglers accounted for $33 \%$ of fishing trips to Kentucky Lake in 2017 ( $33 \%$ in $2015,24 \%$ in 2011 ; Table 51). However, the winter creel showed that crappie anglers accounted for a much higher percentage of the fishing trips ( $82 \%$; Table 65.) Wintertime crappie anglers caught ( $2.04 \mathrm{fish} / \mathrm{hr}$ ) which was slightly lower than the rate observed in the warmer months. Of the crappie caught, $36 \%$ were under harvestable size (Table 66). The catch rates for crappie were highest during December (Table 67.) Extremely cold temperatures throughout most of January probably contributed to the low effort during that month. As part of our efforts to evaluate harvest by method, crappie anglers were recorded as using the following methods: casting, still fishing (1-2 poles), spider rigging ( 3 poles), spider rigging (45 poles), spider rigging ( $>5$ poles). During this survey, $90 \%$ of crappie anglers used 3 or more poles. This percentage is much higher than that observed in warmer months (51\%).

Black bass anglers accounted for $17.6 \%$ of all fishing trips to Kentucky Lake during the 2017-2018 winter creel (Table 65). During older surveys, any bass that was currently in the livewell was recorded as harvested. However, during recent surveys, anglers with bass in the livewell were asked if they intended to release them at the end of the day. In all cases, tournament anglers indicated that they intended to release their fish after the weigh-in. Additionally some non-tournament anglers simply chose to keep fish in the livewell for photographic or "mock tournament" purposes, but indicated that they would release them at the end of the day. As a comparison with previous surveys, bass kept in livewells by anglers were reported as harvested, even though they would be released at the end of the day. Throughout the entire winter survey, no angler reported any harvest of black basses (Tables 68 and 69).

About 6\% of all trips were taken to catch panfish during 2017 (Table 51). However, in the 2017-2018 winter creel, there were no panfish anglers observed (Table 65). Some bluegill were caught incidentally in December, but it seems clear that the wintertime panfish fishery is very small (Tables 70 and 71).

Catfish anglers accounted for $8 \%$ of all fishing trips on Kentucky Lake in 2017 (Table 51). However, as with panfish, there were no catfish anglers observed during the 2017-2018 winter creel. Some channel and flathead catfish were incidentally caught in very low numbers (Tables 72 and 73).

Only about $2 \%$ of the anglers fishing Kentucky Lake during 2017 sought Morones (Table 51). This group includes; white bass, yellow bass, striped bass and hybrids. During the 2017-2018 winter creel, less than $1 \%$ of anglers indicated that they were targeting Morones (Table 65). The majority of the effort came during the month of December (Table 74). Approximately 37\% of the Morones caught were yellow bass, but white bass were the only Morones harvested (Table 75). Harvest of yellow bass remains low despite the removal of harvest restrictions.

## Lake Beshear

Largemouth bass were collected by diurnal electrofishing (120 PPS, DC current) during April at Lake Beshear. One-hundred and eighty-two largemouth bass were collected at a rate of 72.8 fish $/ \mathrm{hr}$ (Table 76). The catch rate of harvestable-size ( $\geq 12.0 \mathrm{in}$ ) largemouth bass was 43.6 fish/hr (Table 77). This year's sample falls slightly below the objective in the Lake Beshear Fish Management Plan (LBFMP) to maintain a catch rate of at least $45.0 \mathrm{fish} / \mathrm{hr}$ for harvestable-sized largemouth bass. The catch of age-1 fish was low this year ( 6.4 fish $/ \mathrm{hr}$ ), but low recruitment is typical in Lake Beshear. Other objectives are to maintain high catch rates of bass $\geq 15.0$ and $\geq 20.0 \mathrm{in}$. Ideally, these catch rates should be greater than 30.0 and 3.0 fish $/ \mathrm{hr}$, respectively. The catch rates for these size classes of bass were above the management objectives. Lake Beshear continues to have a quality bass fishery with high numbers of bass $\geq 15.0 \mathrm{in}$. The fishery rated as "good" in 2017 (Table 78).

Largemouth bass were collected by diurnal electrofishing (120 PPS, DC current) in October (Table 76). The catch rate ( $58.0 \mathrm{fish} / \mathrm{hr}$ ) was lower than reported during similar sampling the past two years. Sampling conditions were reported to be good, although water temperatures were slightly above normal. There is no obvious reason why the catch would have been lower. Relative weight data suggests that the larger bass ( $\geq 15.0 \mathrm{in}$ ) are healthy with regard to their length-weight ratio. The average relative weight value was 92 for these larger bass and 87 for all sizes of bass. The length-weight equation for largemouth bass at Lake Beshear is:

$$
\log _{10}(\text { weight })=-3.53848+3.17297 \times \log _{10}(\text { length })
$$

Otoliths were removed from a subsample of largemouth bass $\leq 10.0$ in to determine the mean fall length of the age- 0 cohort, and determine their catch rate. The catch rate for age- 0 largemouth bass was $38.0 \mathrm{fish} / \mathrm{hr}$ (Table 79). The average length of an age- 0 bass was 4.1 in .

## Lake Pennyrile

Electrofishing for all species of sportfish in Lake Pennyrile was conducted on 1 May 2017. One-hundred and eleven largemouth bass were captured at a rate of $111.0 \mathrm{fish} / \mathrm{hr}$ (Table 80). This catch rate is slightly below the 10 -year average of $113.0 \mathrm{fish} / \mathrm{hr}$. The majority of largemouth bass are still below 15.0 in . Only $5(4 \%)$ bass over 15.0 in were captured in this year's sample. While $10(9 \%)$ were 12.0 in or larger. The catch rate of fish $\geq 15.0$ in ( $5.0 \mathrm{fish} / \mathrm{hr}$ ) is above the 10-year average (Table 81). The catch rate of largemouth bass 8.0-11.9 in was ( 67.0 fish $/ \mathrm{hr}$ ) which falls below the management objective of 80.0 fish $/ \mathrm{hr}$. A high catch rate of intermediate largemouth bass is desirable in order to maintain good numbers of large sunfish in this system.

The catch rate of bluegill $\geq 8.0$ in was $19.0 \mathrm{fish} / \mathrm{hr}$ (Table 82). The catch rate for large-size ( $\geq 8.0 \mathrm{in}$ ) redear was above average ( 18.4 fish $/ \mathrm{hr}$ ). Over the past three years, the catch rate of large bluegill and redear sunfish has been above the 10 -year average. The most probable explanation for these high catch rates is that there are too few large piscivorous predators and too little angler harvest to limit the abundance of large sunfish in the system.

PSD and RSD values for largemouth bass, bluegill and redear sunfish are listed in Table 83. The PSD value for largemouth bass suggests a population skewed toward small bass. The largemouth fishery is likely stunted. PSD's and RSD's are above average for bluegill and redear, and skewed toward more adult fish.

An accurate lake specific assessment for Pennyrile largemouth bass has not been possible in recent years without good age and growth estimates. In 2011 a small sample of bass were aged. In 2011, the largemouth bass population was rated as "fair" (Table 84). In more recent years, assessments have been completed using the age data from 2011. Due to the shift in management focus towards trophy sunfish, it is unlikely that largemouth bass populations will ever be rated highly.

## Ballard County Wildlife Management Area Lakes

During April of 2017, several Ballard County Wildlife Management Area lakes (Little Turner, Big Turner, Shelby, and Castor) were sampled with electrofishing (3-900 second runs at each lake). These lakes are old oxbows of the Ohio River which are primarily managed for waterfowl. The fisheries in these systems fluctuate greatly due to the nearly annual connection with the river during flood events. Big Turner showed the most potential as a largemouth bass fishery ( 33.3 fish $/ \mathrm{hr}$ ) (Table 85). Each of the lakes shows potential for good panfishing, despite low numbers of bluegill $>6.0$ in.

Appendix B. Kentucky Lake creel survey areas, 2017.

## Appendix C. KENTUCKY LAKE ANGLER ATTITUDE SURVEY 2017

1. Have you been surveyed this year? Yes - stop survey

No - continue
2. Name $\qquad$ (Optional) and Zip Code $\qquad$
3. How many times do you fish Kentucky Lake each year?

First time here $3.2 \% \quad 1$ to $410.5 \% \quad 5-10 \quad 16.6 \% \quad$ More than 10 69.6\%
4. Which species of fish do you fish for at Kentucky Lake (check all that applies)? Redear 15.7\% Bluegill 28.4\% Black Bass 62.2\% Crappie 61.4\% Catfish 21.4\% White bass 8.1\% Yellow bass 4.0\% Stripers 0.2\% Sauger 1.0\% Anything 1.4\%
5. Which one species do you fish for most at Kentucky Lake (check only one)?

Redear 0.4\% Bluegill 5.9\% Black Bass 46.4\% Crappie 34.8\% Catfish 8.4\% White bass 1.8\%
Anything 1.4\% Yellow bass .9\%

## Answer the following questions for each species you fish for - (see question 4)

## Redear Anglers

6. In general, what level of satisfaction or dissatisfaction do you have with redear fishing at Kentucky Lake? Very satisfied $11.6 \%$ Somewhat satisfied $41.9 \% \quad$ Neutral $23.3 \% \quad$ Somewhat dissatisfied $17.4 \%$
Very dissatisfied 1.2\% No opinion 4.7\%
6a. If you responded with somewhat or very dissatisfied in question (6) - what is the single most important reason for your dissatisfaction?
Number of fish 100.0\% Size of fish 0.0\% Not happy with regulations 0.0\% Don't know how to catch them 0.0\%

## Bluegill Anglers

7. In general, what level of satisfaction or dissatisfaction do you have with the bluegill fishing at Kentucky Lake Very satisfied 46.2\% Somewhat satisfied 31.4\% Neutral 10.3\% Somewhat dissatisfied 7.7\%
Very dissatisfied 0.6\% No opinion3.8\%
7a. If you responded with somewhat or very dissatisfied in question (7) - what is the single most important reason for your dissatisfaction?
Number of fish $83.3 \%$ Size of fish $16.7 \%$ Not happy with regulations $0.0 \%$

## Black Bass Anglers

8. In general, what level of satisfaction or dissatisfaction do you have with the black bass fishing at Kentucky Lake? Very satisfied 37.4\% Somewhat satisfied 41.9\% Neutral 9.8\% Somewhat dissatisfied 8.1\% Very dissatisfied 1.4\% No opinion 1.4\%

8a. If you responded with somewhat or very dissatisfied in question (8) - what is the single most important reason for your dissatisfaction?
Number of fish 81.3\%
Size of fish $9.4 \% \quad$ Not happy with regulations $0.0 \%$ Too many tournaments $6.3 \%$
Too much pressure 3.1\%

## Crappie Anglers

9. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Kentucky Lake? Very satisfied 51.0\% Somewhat satisfied 29.7\% Neutral 9.8\% Somewhat dissatisfied 5.8\% Very dissatisfied 1.7\% No opinion 2.0\%

9a. If you responded with somewhat or very dissatisfied in question (9) - what is the single most important reason for your dissatisfaction?
Number of fish $76.0 \%$ Size of fish 24.0\% Not happy with regulations 0.0\%

## Catfish Anglers

10. In general, what level of satisfaction or dissatisfaction do you have with the catfish fishing at Kentucky Lake? Very satisfied 58.2\% Somewhat satisfied 27.9\% Neutral 5.7\% Somewhat dissatisfied 4.1\% Very dissatisfied 1.6\% No opinion 2.5\%

10a. If you responded with somewhat or very dissatisfied in question (10) - what is the single most important reason for your dissatisfaction?
Number of fish 100.0\% Size of fish 0.0\% Not happy with regulations 0.0\% Too much commercial fishing 0.0\%

## White Bass Anglers

11. In general, what level of satisfaction or dissatisfaction do you have with the white bass fishing at Kentucky Lake? Very satisfied $38.6 \%$ Somewhat satisfied $36.4 \%$ Neutral $15.9 \%$ Somewhat dissatisfied $0.0 \%$ Very dissatisfied $2.3 \%$ No opinion 6.8\%

11a. If you responded with somewhat or very dissatisfied in question (11) - what is the single most important reason for your dissatisfaction?
Number of fish $100.0 \%$ Size of fish $0.0 \%$ Not happy with regulations $0.0 \%$

## All Anglers

12. Are you satisfied with the current size and creel limits on all sport fish at Kentucky Lake? Yes $87.5 \% \quad$ No $12.5 \%$ 12a. If you responded "No" to Question 11, which species are you dissatisfied with and what size and creel limits would you prefer? Creel Limit (CL), Length Limit (LL), Slot Limit (SL)

Crappie - $10 \mathrm{CL}, 15 \mathrm{CL}, 25 \mathrm{CL}, 30$ per boat CL, 09" LL, 10.5" LL, 11" LL, 12" LL
Bass - Largemouth 13" LL, Largemouth 16", 12" LL, 14 " LL, $16-10$ " SL, smallmouth no harvest >18", smallmouth 18 ",
Largemouth and Smallmouth no harvest $>18$ " or $<15$ "
Bluegill - 30 CL, 8" LL
Redear sunfish - 11 LL
13. Are you aware that the Kentucky Department of Fish and Wildlife creates and maintains shallow water stakebeds marked with white poles, and deepwater brushpiles marked with white buoys as fish attractors in Kentucky Lake? Yes 79.7\% No 20.3\%

13a. When you fish Kentucky Lake, how regularly do you fish around Department placed fish attractors? Always 2.6\% Frequently 25.1\% Occasionally 38.7\% Rarely 17.4\% Never 16.3\%

13b. If you answered "Rarely" or "Never", what is the single most important reason you don't fish around Department placed fish attractors?
Over fished 15.4\% No boat 1.3\% No success 6.7\% Don't know their location 30.9\% Wrong water depth 10.1\% Fishes own stuff 24.2\% Boat too big 0.7\% Get snagged 2.0\% Don't fish structure 0.7\% Don't crappie fish 2.0\%
14. If you fish for crappie, do you spider rig (three or more poles per angler at the same time) as your primary method of crappie fishing?
Yes 23.5\% No 39.5\% Don't Fish 36.9\%
14a. If "Yes", how many poles do you use? 3 14.8\% $4 \quad 41.4 \% \quad 5 \quad 5.5 \% \quad 6 \quad 18.0 \% \quad>6 \quad 20.3 \%$
15. Do you support or oppose a pole limit while fishing for crappie? Support 35.1\% Oppose 17.5\% No Opinion 47.4\%

15a. If you support a pole limit, what should be the pole limit per person?
$\begin{array}{lllllllllllll}18.4 \% & 2 & 15.8 \% & 3 & 37.4 \% & 4 & 24.1 \% & 5 & 2.0 \% & 6 & 8.9 \% & >6 & 3.4 \%\end{array}$
16. If you fish for catfish, do you fish with multiple poles at the same time? Yes 8.0\% No 15.6\% Don't Fish 76.4\%
$\begin{array}{lllllllllllllll}\text { 16a. If "Yes", how many poles do you use? } 2 & 50.0 \% & 3 & 27.3 \% & 4 & 18.2 \% & 5 & 2.3 \% & 6 & 2.3 \% & >6 & 0.0 \%\end{array}$
17. Do you support or oppose a pole limit while fishing for catfish? Support 5.2\% Oppose $12.9 \%$ No Opinion 81.8\%

17a. If you support a pole limit, what should be the pole limit per person?
$126.7 \% \quad 230.0 \% \quad 323.3 \% \quad 413.3 \% \quad 53.3 \% \quad 6 \quad 3.3 \% \quad>6 \quad 0.0 \%$
18. Currently there is no statewide daily creel limit for bluegill, would you support or oppose a bluegill daily creel limit? Support 10.5\% Oppose 22.1\% No Opinion 67.4\%

18a. If you support a creel limit, what number do you consider appropriate for a daily limit of bluegill?
$\begin{array}{llllllllllllllllllllll}10 & 3.3 \% & 12 & 1.7 \% & 15 & 6.7 \% & 20 & 28.3 \% & 25 & 8.3 \% & 30 & 40.0 \% & 35 & 1.7 \% & 40 & 5.0 \% & 50 & 5.0 \%\end{array}$
19. If you fish for bluegill, what do you consider to be a keeper size (inches) fish?

6 18.6\% $79.6 \% \quad 8 \quad 4.5 \% \quad 9 \quad 0.9 \% \quad 10 \quad 0.2 \%$
19a. Which do you consider to be more important: Catching more keeper size bluegill, or more trophy size (>10in) bluegill?
More keepers 82.2\% More trophy size 14.2\% No Opinion 3.6\%
20. If you fish for redear sunfish, what do you consider to be a keeper size (inches) fish? $\begin{array}{llllllllll}6 & 7.8 \% & 7 & 3.0 \% & 8 & 10.1 \% & 9 & 3.5 \% & 10 & 4.8 \%\end{array}$

20a. Which do you consider to be more important: Catching more keeper size redear, or more trophy size (>10in) redear? More keepers $66.7 \% \quad$ More trophy size $30.5 \% \quad$ No Opinion 2.9\%
21. Currently, sunfish ( bluegill, longear, and redear <6 inches) are allowed to be used as bait. How often do you use sunfish as bait?
Always 0.3\% Frequently 1.4\% Occasionally 3.0\% Rarely 3.5\% Never 91.8\%
22. Are you aware that Asian carps are generally considered to be an excellent fish to eat? Yes 63.5\% No 36.5\%

Table 3. Lake specific assessment for largemouth bass collected at Kentucky Lake from 2008-2017. This table includes the parameter estimates and the individual scores as well as the total score and assessment rating. The final two columns list the instantaneous mortality ( $Z$ ) and \% annual mortality (A). Only data collected from Blood River, Big Bear, Jonathan Bay and Sugar Bay were used for historical comparison.

Data from 1985 to 2007 is listed in previous annual reports.
Assessment quartiles were updated in 2015, previous years' APR's will list rating based on old assessment ranges.

A age and growth data was not collected this year, therefore used previous age data set estimates.
2010*, 2011* and 2013* samples were hampered by high water levels during flooding, sample was later than normal; overall a poor sample and not all embayments were sampled.
2012* sample was hampered by low water levels during drought.

Rating
5-7 = Poor (P)
8-11 = Fair (F)
12-16 = Good (G)
17-20 = Excellent (E)

${ }^{\text {A }}$ Data collected by fall (October) diurnal electrofishing. Mean lengths were determined by analysis of otoliths removed from a subsample of LMB <8.0 in and extrapolated to the entire catch of the fall sample. Since 2010, bass up to 10.0 in have been collected for analysis.
${ }^{B}$ Data from diurnal electrofishing samples collected the following spring (April/May).
*2010, 2011 and 2013 spring data was poor due to high water levels.
*2012 spring data was poor due to low water levels.
Data from 1990 to 2007 is listed in previous year reports.

${ }^{\text {A }}$ Indicates year where age and grow th data $w$ as not collected. Age and grow th data from the previous year $w$ as used to calculate the appropriate value.
Data from 1985 to 2007 is listed in previous annual reports.
KLFMP - Kentucky Lake Fish Management Plan objective goal.
Kentucky Lake Crappie Database

Table 15. Lake specific assessment for crappie collected at Kentucky Lake (Blood River and Jonathan Creek) from 2008-2017. This table includes the individual scores for each parameter, as well as the total scores and assessment ratings. The final columns list the instantaneous mortality $(Z)$ and annual mortality $(A)$.

| Year | CPUE age-1 and older | $\begin{aligned} & \text { CPUE } \\ & \text { age-1 } \end{aligned}$ | $\begin{aligned} & \text { CPUE } \\ & \text { age-0 } \end{aligned}$ | $\begin{aligned} & \text { CPUE } \\ & \geq 8.0 \text { in } \end{aligned}$ | Mean length age-2 at capture | Total score | Assessment rating | Z | A |

Table 23. Estimated hatch dates in Jonathan Creek, derived using larval fish lengths back calculated using a growth rate derived from the daily ring counts of juveniles in 2016 and 2015. "\# hatch" represents the time when crappie actually hatched on the nest. "\#spawned" represents the time when crappie eggs were fertilized. Elevation and discharge at Kentucky Dam also provided. Temperature readings taken at Hancock Biological Station in main channel. Environmental variables were provided by TVA and Murray State University.

# NORTHWESTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Table 1 presents a summary of conditions encountered while sampling at state-owned or managed lakes and ACOE reservoirs during the 2017 field season.

## Nolin River Lake

## Black Bass Sampling

Spring (May) and fall (October) electrofishing surveys were conducted in 2017 to monitor the black bass population at Nolin River Lake (Tables 2-9). In 2017, the spring electrofishing catch rates were nearly double those collected in 2016. However, the 2016 catch rates were lower than what has been typically collected over the last 5 years, and the 2017 catch rates are more consistent with those catch rates. Condition factors and age-growth data collected during fall electrofishing were good and consistent with that collected over the last 15 years. Overall, Nolin's largemouth bass population is stable and performing as expected.

## Rough River Lake

## Hybrid Striped Bass Sampling

Gill netting to monitor the hybrid striped bass population was conducted the last week of November (Tables 10-14). Catch rates in 2017, and in 2016, were lower than those collected during the last several surveys. At the same time growth rate, which has always been excellent, has increased and is the highest documented at Rough River Lake since sampling began in 1999. Age-0 fish accounted for $48 \%$ of the total sample (CPUE 15.8), which is three times higher than 2016. Gill netting will continue to be conducted annually for the next few years as part of a project to document any differences in survival and growth rate of reciprocal and original crosses. The hybrid striped bass population continues to be stable and thriving.

## Channel Catfish Sampling

Gill netting to assess the channel catfish population was conducted concurrently with hybrid striped bass sampling. A total of 56 channel catfish were collected over 12 net nights for a CPUE of 4.7 fish per net night (Tables 15-16).
The CPUE is similar to previous collections prior to 2016. A large number of channel catfish were captured in 2016, likely due to water level at time of sampling (lowest on record during sampling). Condition is good and similar to prior collections.

## Dissolved Oxygen - Temperature Profiles

Dissolved oxygen and temperature profiles were conducted in May, June, July, and September in 2017 (Tables 1720). An August sample could not be conducted due to a dissolved oxygen meter malfunction. Profiles were conducted at three sites (lower, middle, and upper) along the main channel of the south fork of the lake on each sample date consistent with samples in previous years. These profiles were conducted as part of a project to document survival and growth of the original and reciprocal hybrid striped bass crosses stocked at Rough River Lake. Profiles will continue to be conducted May - September for the next few years.

## Lake Malone

## Largemouth Bass Sampling

Electrofishing to assess the largemouth bass population at Lake Malone was conducted during April (Tables 21-24). Largemouth bass catch rate data collected in 2017 are similar to catch rate data collected during the last several years. Malone has historically been plagued by an overabundance of bass $<12.0 \mathrm{in}$. A variety of size and creel limits have been tried with little success to reduce this abundance. Even when these fish are not protected, as in the current $12.0-$ to 15.0 -in. protective slot limit, angler harvest is not sufficient to adequately control their numbers. Despite this abundance of smaller-size fish, the number of largemouth greater than 15.0 in. and greater than 20.0 in. has remained in the good to excellent range. The largemouth bass population at Malone is relatively stable and performing as expected. The necessity of continuing the 12.0 - to 15.0 -in protective slot limit will be investigated in 2018.

## Mauzy Lake

## Largemouth Bass Sampling

Electrofishing to assess the largemouth bass population at Mauzy was conducted in April (Tables 23, 25-27). Over the last 3-4 years the catch rate of largemouth less than 12.0 in has increased while the catch rate of bass over 15.0 in has decreased. This trend continued in 2017 with the exception of the catch rate for largemouth 12.0-15.0 in, which increased. Age-growth analysis was conducted in October 2015 and indicated length at age data had declined dramatically when compared to age-growth analysis in 2012 and prior samples. Annual sampling continue to monitor this trend and age data will be collected again in 2018. Due to multiple drawdowns for repair work, vegetation control, and an attempted shad kill, the lake has not maintained a normal pool for multiple consecutive years since 2009. A few consecutive years with a stable normal pool should allow for a determination of the direction of this fishery.

## Bluegill Redear Sunfish Sampling

Electrofishing to assess the bluegill and redear sunfish populations was conducted in April (Tables 28-32). Both bluegill and redear sunfish catch rates have been variable over the last few years, but the general trend has been a decrease in the catch rate of bluegill and an increase in the catch rate of redear sunfish. This trend persisted in 2017. In 2017, a total of 186 bluegill ( $248.0 \mathrm{fish} / \mathrm{hr}$ ) and 338 redear sunfish ( $450.7 \mathrm{fish} / \mathrm{hr}$ ) were collected in 0.75 hours of electrofishing. While bluegill have historically been sampled in mid-May, an earlier April sampling date was selected in 2017 due to an abundance of shoreline Eurasian watermilfoil present in mid-May that makes efficient netting difficult. The earlier sampling date could explain part of the increase in the number of redear and decrease in the number of bluegill collected in 2017, but this trend has also been observed over the last few years during the traditional mid-May sampling time.

Bluegill were last collected for age-growth analysis in October 2015. Mean length at age was lower for each age class when compared to the preceding collection in 2012. In 2015, the mean length at age-2 at capture and the number of years to reach 6.0 in were both some of the worst recorded to date.

Redear sunfish were stocked in Lake Mauzy in 2004 and 2005, but few redear sunfish were collected prior to 2010. Since 2010, the general trend has been an increase in the catch rate of redear sunfish. Despite this continued increase, no redear sunfish greater than 9.0 in have been collected. Redear sunfish were last collected for age-growth analysis with bluegill in October 2015. Age data suggested growth has continually slowed at each age class over the last 8 years. As the catch rate has increased, redear seem to be plateauing in the 8.0 - to 9.0 -in range.

Intensive sampling of the largemouth bass, bluegill and redear sunfish populations, including age data, will be conducted during 2018 to better define these populations and develop a management strategy moving forward.

## Carpenter Lake

## Largemouth Bass

Largemouth bass were sampled at Carpenter Lake in April 2017 (Tables 23, 33-35). Total CPUE was within the range of previous samples. Catch rate for fish 12.0-14.9 in was the highest observed since 1999 (CPUE 100.0 fish $/ \mathrm{hr}$ ), yet catch rates for all other length groups was lower than 2016. Bass for age-growth analysis were last collected in 2015. The 2015 growth rate had declined by 1.0 in since 2006. Age-growth data will again be collected in 2018 to see if mean length continues to decline. It will also provide baseline data prior to the introduction of saugeye in 2018. Saugeye will be stocked in 2018 in an attempt to control the gizzard shad population.

## Bluegill Redear Sunfish Sampling

Electrofishing to assess the bluegill/redear sunfish populations was conducted in April (Tables 30, 36-38). Catch rates for small bluegill ( $<6.0 \mathrm{in}$ ) in 2017 were well above the 10 -year average. Catch rates for 6.0 - to 7.9 -in bluegill had increased slightly from 2016 and are closer to anticipated values. Both 2013 and 2014 had exceptionally high catch rates for $6.0-$ to 7.9 -in fish which have skewed the long term average. In the last decade only one bluegill greater than 8.0 in has been collected in Carpenter Lake. Gizzard shad were first discovered in the lake in 2006 and seem to be negatively affecting the bluegill population. After two failed shad eradication efforts, saugeye will be stocked at 50 fish/acre beginning in 2018 in an attempt to reduce the number of gizzard shad and small crappie. This reduction should positively affect bluegill growth and produce bluegill greater than 8.0 inches in the near future. Bluegill age and growth data will be collected in 2018 to establish baseline data prior to saugeye introduction.

Fifty-two redear sunfish were collected in April in conjunction with bluegill sampling. Overall, catch rates for all length groups increased from 2016 and fall within expected ranges. Redear sunfish less than 3.0 in have yet to be found in collections since 2010 . That is likely a result of sampling inefficiencies rather than lack of reproduction. This is evidenced by the large increase in $3.0-$ to 5.9 -in fish observed this year. Numbers remain fairly low but quality fish are available. Redear sunfish will be collected in conjunction with bluegill for age-growth analysis in 2018.

## New Kingfisher Lakes

## Largemouth Bass

Electrofishing to assess the largemouth bass population at New Kingfisher Lake was conducted in April and October (Tables 23, $39-42$ ). The April sampling was the first standardized sample collected since 2012. A total of 55 largemouth bass were collected in 0.375 hours of sampling. Catch rates for bass less than 12.0 in are lower than prior to renovation, but this is to be expected soon after re-stocking. The catch rate of fish 12.0-14.9 in is similar to pre-renovation samples and the CPUE of fish greater than 15.0 in is the highest ever collected. The presence of these large fish would indicate either there is exceptional growth of the stocked fish (not likely), they are hold overs from the renovation that escaped the rotenone (plausible), or thoughtful anglers have provided theses additional fish, which is the most likely scenario. Regardless of the reason, several preferred-size fish are present in the population. During October, another 31 fish were collected ranging from 6.0 to 19.0 in. The largemouth bass fishery should continue to grow and develop over the next few years.

## Bluegill Redear Sunfish Sampling

The sunfish population was sampled via electrofishing in April (Tables 30, $43-45$ ). Total CPUE was the highest collected since 1999. Bluegill 3.0-5.9 in accounted for $90 \%$ of that total. As the largemouth bass population continues to grow, predation pressure will increase on the small bluegill enhancing their growth rate and size structure. Redear sunfish were not stocked following the renovation, but several have been collected. Their origin is questionable but presence is acceptable. Age data will be collected in the future once the populations have stabilized.

Despite a rotenone treatment of all remaining water following the renovation, gizzard shad were observed during both spring and fall samples. The bluegill population will be monitored to ensure adequate growth and size structure develops, and if not, shad control methods will be invoked. Potential options available for controlling the shad population will be wintertime rotenone treatments and/or saugeye stocking if that proves to be a successful method in Carpenter Lake.

## Old Kingfisher Lake

## Largemouth Bass

Electrofishing to assess the largemouth bass population was conducted at Old Kingfisher Lake in April and October (Tables 30, 46-49). A total of 72 bass were collected ranging from 4.0 to 20.0 in . Catch rates for each length group is similar to 2017 rates at New Kingfisher. As in New Kingfisher, there are several large fish present of unknown origin. Fewer fish were collected during the October sample but still ranged from 5.0 to 19.0 in . Weights were not collected at this time, but will be collected in the future with growth rate data.

## Bluegill Redear Sunfish Sampling

The sunfish population at Old Kingfisher Lake was sampled via electrofishing in April (Tables 30, $50-52$ ). Total bluegill CPUE was 1333.3 fish $/ \mathrm{hr}$ with just over $70 \%$ made up of 3.0 - to 5.9 -in fish. Catch rate of $6.0-$ to 7.9 -in fish ( 309.3 fish $/ \mathrm{hr}$ ) was also very good and higher than all but the two banner years at Carpenter Lake. There were no 8.0 -in fish collected but some should be seen in 2018. Gizzard shad were noted during both spring and fall samples. We will keep an eye on the bluegill population to ensure progress continues, otherwise alternative strategies will need to be invoked. Two potential options for controlling the shad are winter shad eradications and saugeye stocking.

Old and New Kingfisher are now connected by a six-foot metal culvert and should presumably develop nearly identical fish populations. If, after several years, both Old and New Kingfisher show similar population characteristics, sampling data may be combined and reported together as Kingfisher Lake.
*Old and New Kingfisher were drawn down December 2012 to complete renovation work. The lakes were allowed to dry during 2013 and renovation work was completed during the summer of 2014. As water levels increased, channel catfish, bluegill and advanced fingerling largemouth bass were stocked in fall of 2015.

## Washburn Lake

## Largemouth Bass

Electrofishing to assess the largemouth bass population at Washburn Lake was conducted in April and October (Tables 23, $53-59$ ). The population has been relatively stable over the past several years and comprised mostly of fish less than 12.0 in with one or two larger fish collected. Catch rate for bass less than 8.0 in was the highest since 2001. Catch rate for 8.0 - to 11.9 -in ( 306.7 fish $/ \mathrm{hr}$ ) and 12.0- to 14.9 -in ( $42.7 \mathrm{fish} / \mathrm{hr}$ ) fish increased from 2016. Total CPUE was the highest recorded since renovation. Largemouth bass were sampled again during October to determine condition factor and age and growth statistics. Condition factors (Wr) are within the range typically encountered in NWFD lakes. Mean length at age remains similar to the last age data collection (2010) and fish continue to be stockpiling at approximately 12.0 in . The fertility issue has yet to be identified or resolved and water clarity can range from gin clear to pea soup within a week's time. Submerged aquatic vegetation has also become an issue that requires chemical treatment multiple times a year. There are likely several factors contributing to the poor quality of this fishery. Treating vegetation in a timely manner to facilitate improved bass foraging, and angler access, will be attempted. Using trail cameras to document angler usage will be discussed. Lake renovation plans to dredge and deepen extensive shallow areas will also be discussed and will take place when the water control structure is replaced.

## Bluegill Redear Sunfish Sampling

The sunfish population was sampled via electrofishing in May (Tables 30, 60-62). Almost equal numbers of bluegill and redear sunfish were collected in 2017. Bluegill catch rate is similar to previous collections but distributed a little differently than usual. Washburn is the only state lake sampled in NWFD to produce 8.0 -in bluegill in 2017. Bluegill age and growth statistics have not been determined since 2009 and data will be collected in 2018. Redear sunfish have been on a general rise since 2012 but catch rates are similar to previous collections.

## Honeycomb Lake (Peabody WMA)

Electrofishing to assess the sunfish population at Honeycomb Lake was conducted in April (Tables 30 and 63). We have been trying to establish a trophy sunfish fishery in this lake over the last several years. Redear sunfish have been stocked on two occasions, and spawning gravel, and dense habitat has been added. The April sample allowed us to collect more redear sunfish than usual but did not seem to affect our bluegill catch. Fertilization efforts will continue in 2018 and more fish habitat will be added as time allows. We hope to get a gravel road and boat ramp constructed to facilitate easier access for management activities. The fishery is progressing well and efforts will continue.

## Lil Gill Lake (Peabody WMA)

Electrofishing to assess the sunfish population at Lil Gill Lake was conducted in April (Tables 30 and 64). We have been trying to establish a trophy sunfish fishery in this lake over the last several years. We collected more redear sunfish than bluegill in 2017. The fishery seems to be progressing well and efforts will continue. The lake will be fertilized again in 2018 and fish habitat will be added as time allows.

# SOUTHWESTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Lake sampling conditions are summarized in Table 1.

## Barren River Lake (10,000 acres)

## Black Bass

Black bass were collected with diurnal electrofishing in mid-April from both lake arms (Tables 2-5). A total of 873 black bass were collected at a rate of 145.5 fish/hr (Table 2). The overall catch rate for largemouth bass (124.7 fish $/ \mathrm{hr}$ ) increased from the previous two years (Table 3). Largemouth bass made up $86 \%$ of the total catch while spotted bass made up $14 \%$ (Table 2) and their distribution remains tied to the lower $1 / 3$ of the reservoir. The 2016 spawn resulted in a strong age-1 year class (age-1 CPUE $=39.5$ fish $/ \mathrm{hr}$; Table 4), which was up from the previous two years. The largemouth bass population assessment rated "Excellent".

Largemouth bass size structure indices ( $\mathrm{PSD}=70$ and $\mathrm{RSD}_{15}=38$; Table 5) were higher than previous year averages. Spotted bass size structure remains high quality as well ( $\mathrm{PSD}=69$ and $\mathrm{RSD}_{14}=32$ ). The smallmouth bass population remains poorly represented in samples (Tables 2 and 6 ), but larger fish are reported by anglers.

Fall young of year sampling (Tables 6 and 7) suggested a moderate 2017 year-class. Largemouth bass made up the majority of the fall sample ( $93 \%$ ), while spotted bass only made up $7 \%$ of the sample (Table 6). Smallmouth bass remain poorly represented in samples. Age-0 CPUE ( 150.2 fish $/ \mathrm{hr}$; Table 7) and age-0 CPUE $\geq 5.0$ in ( $23.5 \mathrm{fish} / \mathrm{hr}$ ) was lower when compared to most years. Age-0 largemouth bass mean length ( 4.0 in ) was average compared to most years.

## Crappie

Trap netting for crappie yielded 902 total crappie ( 521 black crappie and 381 white crappie) in 85 net-nights (Table 8). The crappie population appears to remain an even mix of both species ( $58 \%$ white and $42 \%$ black). Age- 0 catch rates of both species represented $25 \%$ of total crappie catch ( $6 \%$ of white crappie and $40 \%$ of black crappie catch rates; Tables 9 and 10). The population is reflective of good 2015 and moderate-poor 2016 year classes for both species (Tables 9 and 10). White crappie reached harvestable size ( 9.0 in ) in 1.6 years and 10.0 inches in 2.3 years (calculated from Von Bertalanffy equation; FAST 3.0 software). Black crappie reached harvestable size ( 9.0 in ) in 2.7 years and 10.0 inches in 3.8 years (calculated from Von Bertalanffy equation; FAST 3.0 software). The assessment rating remained "Fair" for black crappie, while white crappie dipped to a "Fair" assessment (Tables 11 and 12). This resulted in an overall crappie assessment rating of "Fair" (Table 13). The length-weight equations for black crappie $(\mathrm{n}=315)$ and white crappie $(\mathrm{n}=361)$ are:

$$
\begin{aligned}
& \text { Black crappie } \log _{10}(\text { weight })=-5.92623+3.46988^{*} \log _{10}(\text { Length }) \\
& \text { White crappie } \log _{10}(\text { weight })=-5.62311+3.32189^{*} \log _{10}(\text { Length })
\end{aligned}
$$

## Hybrid Striped Bass

Gillnet sampling for hybrids in late September/early October yielded a good catch rate ( 15.5 fish $/ \mathrm{nn}$ ) overall, with mostly larger ( $\geq 13.0 \mathrm{in}$ ) sizes represented (Table 15). The double stocking rate ( $\mathrm{n}=400,000$ ) year class of 2013 (age$4+$ ) has subsisted well in the fishery; however, similarly stocked year classes (2015 and 2016) have not performed as well (Table 16). The assessment rating for the fishery improved to "Excellent" due to the increase in the catch rates of larger-sized ( 15.0 -in plus) and age- 1 fish (Table 17). Larger-sized fish were in better condition ( $\mathrm{Wr}=88$; Table 18) than the 2015 sample ( $\mathrm{Wr}=79$ ), but remained lower than average relative weights (mid-upper 90 's) from prior years. The length-weight equation for hybrid striped bass $(\mathrm{n}=93)$ was:

$$
\log _{10}(\text { weight })=-5.79652+3.34046 * \log _{10}(\text { Length })
$$

## Briggs Lake (18 acres)

## Sunfish

The sunfish population was sampled by diurnal electrofishing on April 17 (Table 19). Overall CPUE of bluegill ( $218.0 \mathrm{fish} / \mathrm{hr}$ ) was slightly lower than the average from previous years (Table 20). Redear CPUE (202.0 fish/hr) was similar to recent years (Table 21). The catch rate of the $\geq 8.0$-in length group ( 126.0 fish $/ \mathrm{hr}$ ) achieved its' highest CPUE ever recorded at the lake. Size structure indices for bluegill ( $\mathrm{PSD}=44$ ) dipped significantly from $2015(\mathrm{PSD}=44)$ while indices for redear $(\mathrm{PSD}=69)$ continued to reflect high quality fisheries (Table 22). The population assessments for both bluegill and redear remain "Excellent", similar to previous years (Tables 23 and 24). Sampling of smaller-sized redear remains enigmatic and a poor predictor of year class strength. Redear lengthfrequency from hoop net samples (Table 25) was similar to the spring electrofishing sample.

## Channel Catfish

Channel catfish were sampled with tandem set hoop nets in mid-June and late August with limited success (3.1 fish/set-night; Table 25). Only age-1+ fish (stocked in fall of 2016) were collected (Table 26) and they were in excellent condition ( $\mathrm{Wr}=97$; Table 27). Dissolved oxygen levels remained good ( $>7 \mathrm{ppm}$ ) throughout the sampling period and seemingly not a factor in low catch rates. Due to this year's and the previous year's poor sample, the stocking rate was doubled to 50 fish per acre every even year.

## Green River Lake (8,210 Acres)

## Muskie

Muskellunge sampling continues to be problematic as multiple attempts (Table 1) were made with diurnal and nocturnal electrofishing with poor results. Samplings results seemingly do not reflect the current population (2014 angler attitude survey and angler catch rates) or historic sampling norms. As a result, no catch data is presented for this year. Muskie growth rates and condition data will be presented in the Fish Habitat Branch APR.

## Black Bass

Nocturnal bass electrofishing was conducted on the upper and lower ends of each lake arm (Green River and Robinson Creek) during late-April and early-mid May (Table 28). Overall bass CPUE was $226.9 \mathrm{fish} / \mathrm{hr}$, bolstered by a good 2016 year class from all three bass species.

The overall largemouth CPUE of 164.0 fish $/ \mathrm{hr}$ is the highest noted as is the catch rate of largemouth $\geq 15.0$ inches ( 59.8 fish $/ \mathrm{hr}$ ) and remains well above average (Table 29). Largemouth bass size structure indices dipped slightly ( $\mathrm{PSD}=71$; RSD $=43$; Table 30) from previous years' values. The population assessment for largemouth bass remained "Excellent" which is similar to most recent years (Table 31).

Spotted bass catch rate ( 55.7 fish $/ \mathrm{hr}$ ) nearly doubled from last year, attaining more historic levels (approximating 50.0 fish $/ \mathrm{hr}$ ). The population continues to produce fish $>12.0$ inches in length, which was rare prior to alewife introduction in 2004, when few spotted bass achieved such lengths.

Fall YOY sampling (Tables 32 and 33) suggests a very good largemouth bass year class in 2016, but a weaker 2017 year class, as age-0 overall CPUE ( $19.0 \mathrm{fish} / \mathrm{hr}$ ) and age-0 CPUE $\geq 5.0$ in ( $7.0 \mathrm{fish} / \mathrm{hr}$ ) were both well below average. Mean age- 0 largemouth bass length ( 4.8 in ) was slightly above average.

## Walleye/White bass

Experimental gill net sampling for white bass and walleye during mid-November produced moderate catch rates for both species (Table 34). White bass CPUE ( $10.1 \mathrm{fish} / \mathrm{nn}$ ) dipped from 2015, but was still dominated by the 2014 year class (age-3+; Table 35). The moderate 2015 year class marks a significant all-natural contribution to the fishery, even though the spawning population density was low. Growth rates (mean length age $-2+=14.3$ in; Table
37) and condition indices for all size ranges ( $\mathrm{Wr}=95-98$; Table 39) of white bass has been excellent. The white bass population assessment fell to "Good", due to low age-1+ fish densities (weak 2016 year class). The lengthweight equation for white bass ( $\mathrm{n}=94$ ) was similar to previous years:

$$
\log _{10}(\text { weight })=-3.44205+3.10253 * \log _{10}(\text { Length })
$$

Walleye CPUE ( 2.8 fish $/ \mathrm{nn}$ ) increased slightly from 2015 with multiple year classes (age-0 through age-5) represented (Tables 34 and 36). Growth rate ( 19.5 in by age-2+; Table 38) and condition indices for all size ranges ( $\mathrm{Wr}=93-101$; Table 40) remain excellent. The walleye population assessment remained "Good". The lengthweight equation for walleye $(\mathrm{n}=33)$ was similar to previous years:

$$
\log _{10}(\text { weight })=-3.81301+3.31099 * \log _{10}(\text { Length })
$$

## Mill Creek Lake (109 acres)

## Black Bass

Bass were sampled by nocturnal electrofishing on April 12 (Table 1); results are presented in Tables 41-43. Largemouth bass catch rates of fish $\geq 15.0$ in ( 50.7 fish $/ \mathrm{hr}$ ) and fish $\geq 20.0 \mathrm{in}$ ( $8.7 \mathrm{fish} / \mathrm{hr}$ ) remains excellent, similar to previous years (Table 42). Size structure indices ( $\mathrm{PSD}=65$; RSD $=43$; Table 43) remain very good. Age data has not been collected from this population.

## Shanty Hollow Lake (136 acres)

## Sunfish

Sunfish (bluegill and redear) were sampled by diurnal electrofishing on April 26. Catch rates of intermediate-size bluegill improved significantly, but still lag below historic values (Table 45) despite resuming lake fertilization in 2016 after a 3-year hiatus (2013-2015). Bluegill size structure has slid from a PSD = 58 in 2015 to PSD = 31 (Table 47). Bluegill population assessment remains "Fair", similar to recent years (Table 48).

The redear population remains low density (CPUE $=19.2$ fish $/ \mathrm{hr}$; Table 44 and 46 ), but with good size structure (PSD $=48, \mathrm{RSD}=32$; Table 47). The population assessment rated "Fair", deviating from "Good" ratings from recent years (Table 49). Redear length-frequency derived from hoop net samples (Table 50) was similar to the spring electrofishing sample.

## Channel Catfish

Tandem hoop nets were deployed from September 5-11 with poor results (Tables 50 and 51). Nets were fished in suitable dissolved oxygen levels ( $5-9 \mathrm{ppm}$ ) and captured miscellaneous other fish species, but only five channel catfish (age-3+ and 4+). Hoopnetting done from 2007-2011 by Black Bass/Warm Water Fisheries Research crews yielded catch rates ranging from $70-139$ fish/set. Recent stocking rates may explain some of the decline in catch as the lake was only stocked once in the last 3 years (2016; at reduced rate of 10 fish/a).

## Spurlington Lake (25 acres)

## Channel Catfish

Tandem hoop nets were deployed from September 5-11 with poor results (Tables 52 and 53). Nets were fished in suitable dissolved oxygen levels ( $7-9 \mathrm{ppm}$ ) and captured miscellaneous other fish species, but only seven channel catfish representing six year classes (age- $1+$ to $6+$ ). Recent stocking rate changes may explain some of the decline in catch as the lake was only stocked once in the last 3 years (2016; at 25 fish/a).

## Fagan Branch Lake (140 acres)

## Black bass

Largemouth were sampled on November 27 for condition indices (Table 1). Largemouth condition remains low across all size groups ( $\mathrm{Wr}=79-86$; Table 54) and similar to previous samples from $2001(\mathrm{Wr}=80-85)$ and 2002 ( $\mathrm{Wr}=81-88$ ). The length-weight equation for largemouth bass $(\mathrm{n}=114)$ was similar to previous years:

$$
\log _{10}(\text { weight })=-3.59504+3.19619 * \log _{10}(\text { Length })
$$

Lake infertility (secchi depths ranging from 12 to 22 feet) and significant aquatic vegetation stands (brittle naiad and American pondweed) contribute to bass crowding and likely poorer foraging success.

Table 1. Lake sampling conditions in the Southwestern Fisheries District in 2017.

| Lake | Date | Species | Weather | Water temp. surface (F) | Conductivity (umhos) | Secchi <br> (in.) | Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

# CENTRAL FISHERIES DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Lake sampling conditions for 2017 are summarized in Table 1.

## Taylorsville Lake (3,050 acres)

Spring diurnal electrofishing was completed in April 2017 to assess the black bass population. Three sections (Big Beech Creek, Ashes/Jacks Creek, and Van Buren area) of Taylorsville Lake were sampled for 7.5 hours ( 2.5 hours per section; 30-minute runs). Length distribution and CPUE for largemouth bass are presented in Tables 2 and 3. The catch rate of bass collected in 2017 ( $171.1 \mathrm{fish} / \mathrm{hr}$ ) was higher than the lake's historical average of 116.3 fish $/ \mathrm{hr}$. Catch rate for keeper bass ( $\geq 15.0 \mathrm{in}$ ) was $46.9 \mathrm{fish} / \mathrm{hr}$; higher than the lake average ( $18.5 \mathrm{fish} / \mathrm{hr}$ ) and was the highest catch rate recorded for harvestable-size fish. Big Beech Creek area recorded the highest catch rate for largemouth bass. The PSD for largemouth bass was 82, which was higher than the lake's average of 56 (Table 4). Additionally, the $\operatorname{RSD}_{15}$ value was 32 ; higher than the lake's average of 22. The largemouth bass population assessment score, based on spring electrofishing data, was 16 ("Good"), which is equal to the average rating at Taylorsville Lake (Table 5).

Length frequency, relative weights, and index of year class strength at age- 0 and age- 1 of largemouth bass based on September electrofishing are presented in Tables 6-8. Average body condition for largemouth bass was good in $2017\left(\mathrm{~W}_{\mathrm{r}}=92\right)$, but was slightly lower than the historical average $\left(\mathrm{W}_{\mathrm{r}}=96\right)($ Table 7$)$. Catch rate of age-0 largemouth bass in the fall of 2017 (46.2 fish/hr) was higher than the lake's historic average of $42.1 \mathrm{fish} / \mathrm{hr}$ (Table 8). The year class strength model indicated above average recruitment for young-of-the-year largemouth bass in 2017, therefore no largemouth bass fingerlings were stocked during 2017. However, 989 6- to 8 -inch largemouth bass were stocked into Taylorsville Lake due to a bass removal from Beaver Lake. Largemouth bass fingerlings have been stocked almost annually since 2000 at rates ranging from 5.0 fish/acre to 10.0 fish/acre and from 1985 to 1992 at various rates. The need for stocking and the numbers stocked in reservoirs are based (since 2004) on results of the age- 0 year class strength sampled in early September and the predicted age-1 year class strength the following spring.

Trap netting effort for crappie (Table 9) resulted in the collection of 614 white crappie and 181 black crappie. Crappie were sampled with trap nets during 48 net-nights. PSD and $\mathrm{RSD}_{10}$ values are shown in Table 10. Age and growth determinations along with age frequency for black and white crappie were completed using otoliths and are shown in Tables 11-14. Age studies indicated both white and black crappie reach 9.0 in between age 2 and age 3. The crappie population assessment scores (Tables 15 and 16) rated both white and black crappie as "Fair". Historically, the crappie population at Taylorsville Lake has been very cyclic with peaks occurring every 7 to 9 years. In an effort to help recruitment on the lake, white crappie were stocked from 2009 through 2013. Significant spawns have occurred in both 2013 and 2015, however the 2016 and 2017 spawn appeared to be poor based off trap net data. Body condition of white and black crappie in the fall of 2017 were acceptable, but the black crappie are lower than expected for Taylorsville Lake (Table 17).

Fall gill netting for hybrid striped bass and white bass was conducted in October 2017 (Tables 18-26). A total of 125 hybrid striped bass were collected in 2017 compared to 167 in 2016, 47 in 2015, and 90 in 2014, Hybrid striped bass were captured in 8 net-nights (4 nets for 2 nights) for a CPUE of $12.5( \pm 3.6)$ fish $/ \mathrm{nn}$. The hybrid striped bass population has exhibited notable fluctuations since 1990. The density of hybrid striped bass in Taylorsville Lake appeared to be negatively correlated with the amount of tailwater discharge (due to rainfall) and fishing pressure. It is theorized that above-normal discharge leads to escapement of hybrid striped bass but has little effect on the white bass density in the lake. Additionally, a late fall water quality issue with low oxygen in the lower portion of Taylorsville Lake may be causing additional stress on the hybrid striped bass. Age and growth studies were completed for hybrid striped bass using otoliths (Tables 19 and 20). Data indicate hybrid striped bass reached 15.0 in between one to two years. This is good growth for hybrid striped bass at Taylorsville Lake. The relative weight $\left(\mathrm{W}_{\mathrm{r}}\right)$ index for hybrid striped bass (85) continues to show below average body condition at Taylorsville Lake
(Table 21). The average $\mathrm{W}_{\mathrm{r}}$ for Taylorsville Lake is 86 . The population assessment for hybrid striped bass was rated at "Fair", an average rating for hybrid striped bass at Taylorsville Lake (Table 22). Annual stocking rates for hybrid striped bass have been 20 fish/acre ( 1.4 to 2.0 in ) for the last 15 years. Taylorsville Lake was stocked with 61,206 (20.1 fish/acre; 1.5 in) hybrid striped bass in June 2017. The 2017 hybrid striped bass stocking in Taylorsville Lake included both crosses of hybrid striped bass ( 30,588 reciprocal cross hybrids (no OTC mark) and 30,618 original cross hybrid striped bass (OTC marked)). Data for white bass collected during fall 2017 gillnetting studies are presented in Tables 18 and 23-26. White bass comprised about $17 \%$ of the Morones sampled, compared to $35 \%$ in $2016,27 \%$ in 2015 , and $47 \%$ in 2014 , Age and growth studies indicated white bass reach 12.0 in by age 3 (Tables 23 and 24). Relative weight values ( $\mathrm{W}_{\mathrm{r}}=93$ ) revealed acceptable body condition for all sizes of white bass (Table 25). The white bass population assessment was rated "Poor", an average rating for white bass at Taylorsville Lake (Table 26).

Saugeye were collected during fall gill netting conducted in October. A total of 40 saugeye were collected ranging from the 9.0-19.0 inch class (Table 18). Taylorsville Lake was stocked with 115,261 (37.8 fish/acre; 1.7 in ) saugeye in 2017. This was the third stocking of saugeye into Taylorsville Lake.

Summer diurnal low-pulse electrofishing was completed in July 2017 to assess the blue catfish population. Two sections (Lower Lake: Big Beech Creek and Ashes/Jacks Creek and Upper Lake: Chowning Lane and Van Buren areas) of Taylorsville Lake were sampled for 3.0 hours (15-minute runs). Two hundred and fifty-one blue catfish were collected in the lower section compared to 399 blue catfish collected in the upper section of the lake (Table 27). The number of blue catfish collected in 2017 ( 216.7 fish/hr) was significantly higher than the lake's historic average of 122.8 fish $/ \mathrm{hr}$ and the second highest catch rate of blue catfish since blue catfish have been stocked into Taylorsville Lake (Table 28). Relative weight values revealed good body condition for all sizes of blue catfish (Table 29). A total of 23,540 (7.7 fish/acre) blue catfish (6.0-9.0 in) were stocked in Taylorsville Lake during April 2017. Additionally, another 27,520 (9.0 fish/acre) blue catfish (5.0-18.0 in) were stocked in Taylorsville Lake during October 2017.

Dissolved oxygen and temperature profiles were completed from April through November at Taylorsville Lake. Three sites were sampled during 2017, including Big Beech Creek near Settlers Marina (no wake buoy line; Table 30), the mouth of Ashes and Jack's Creek (no ski buoy line; Table 31), and VanBuren / Chowning Lane Area (no ski buoy line; Table 32). The thermocline became well established from June through September. Dissolved oxygen levels suitable for fish ( $\geq 4 \mathrm{mg} / \mathrm{l}$ ) could generally be found from $0-12 \mathrm{ft}$ deep during the summer months. There was a decline in oxygen throughout the water column in the lower portions of Taylorsville Lake during November. These late season declines in oxygen may be a result of decomposition from significant blooms of bluegreen algae that occurred during the summer months at Taylorsville Lake. Lake temperatures peaked during the month of August in the mid 80-degree range.

## Herrington Lake (2,410 acres)

Spring diurnal electrofishing studies were completed in April 2017 to monitor the black bass population. Upper, middle, and lower sections were sampled for a total of 7.5 hours ( 2.5 hours per section). Species composition, relative abundance, and CPUE of black bass collected in the spring are presented in Table 33. Largemouth bass ( $94.8 \%$ ) dominated the black bass fishery, followed by spotted bass (5.1\%) and smallmouth bass ( $0.1 \%$ ). Numbers of largemouth bass collected in 2017 ( $114.0 \mathrm{fish} / \mathrm{hr}$ ) was comparable to the lake's historic average of $113.8 \mathrm{fish} / \mathrm{hr}$ (Table 34). Fluctuations in the overall catch rates over the past couple of years seem to be related to lake level during sampling. The higher the lake level the lower the catch rate of bass at Herrington Lake. The lake level during the 2017 spring electrofishing sample was low, which may have led to a slight increase in the catch rate for largemouth bass. Catch rate for keeper bass ( $\geq 12.0 \mathrm{in}$ ) was $47.1 \mathrm{fish} / \mathrm{hr}$, comparable to the lake's historical average ( $44.9 \mathrm{fish} / \mathrm{hr}$ ). Overall, black bass catch rates were comparable in all three sections. The PSD for largemouth bass was 54 , comparable to the lake's average of 56 (Table 35). Additionally, the RSD 15 value was 19, which is lower than the lake average of 24. The largemouth bass population assessment score, based on spring electrofishing data, was 16 ("Good"), which is the average rating for Herrington Lake (Table 36). Length frequency, relative weights and index of year class strength at age- 0 and age- 1 of largemouth bass based on September electrofishing at Herrington Lake are presented in Tables 37-39. Largemouth bass condition ( $\mathrm{W}_{\mathrm{r}}=91$ ) was slightly lower than the lake's historical average $\left(\mathrm{W}_{\mathrm{r}}=92\right)$ (Table 38). The year class strength model for

Herrington Lake indicated a below average recruitment year for young-of-year largemouth bass based on age-1 CPUE (Table 39). Age-0 CPUE ( $26.0 \mathrm{fish} / \mathrm{hr}$ ) was less than the lake average ( $36.4 \mathrm{fish} / \mathrm{hr}$ ). Herrington Lake was stocked with 40,112 (16.6 fish/acre) largemouth bass (4.1-4.7 in) in 2017.

Gill netting for hybrid striped bass and white bass was completed in October and November 2017. During the 30 net-night sampling period, 156 hybrid striped bass and 76 white bass were collected (Table 40). Otoliths were taken from both species for age and growth determinations. Results of these studies indicated excellent growth rates for both hybrids (Tables 41-42) and white bass (Tables 45-46). Hybrid striped bass continue to reach 15.0 in between age 1 and 2 (Table 41), as they have historically. Of the hybrid striped bass sampled, $60 \%$ were age- $1+$ or older (Table 42). Condition of hybrid striped bass in $2017\left(\mathrm{~W}_{\mathrm{r}}=95\right)$ was higher than the lake's historical average ( $\mathrm{W}_{\mathrm{r}}=93$ ) (Table 43). The population assessment for hybrid striped bass indicated a "Fair" population (Table 44). White bass age and growth determinations showed they reached 12.0 in between age- 1 and age- 2 (Table 45). Of the white bass sampled, $91 \%$ were age- $1+$ and older (Table 46). The white bass population assessment indicated a "Fair" population, which is an average rating (Table 47). Body condition of white bass ( $\mathrm{W}_{\mathrm{r}}=93$ ) was lower than the lake's historical average ( $\mathrm{W}_{\mathrm{r}}=96$ ) (Table 48). Herrington Lake was stocked with 51, 150 (21.2 fish/acre; 1.5 in ) hybrid striped bass in June 2017. The hybrid striped bass stocking was divided into 25,635 reciprocal cross hybrids (no mark) and 25,515 original cross hybrids (OTC marked).

Dissolved oxygen and temperature profiles were completed from April through November at Herrington Lake. Three sites were sampled at Herrington Lake during 2017, including the mouth of Cane Run (no wake buoy line; Table 49), near Gwynn Island Marina (no wake buoy line; Table 50), and near King's Mill Marina (no wake buoy line; Table 51). The thermocline appeared in May and became established during the months of June through October. However, near the dam at the Cane Run sample site a layer of dissolved oxygen $>4.0 \mathrm{ppm}$ was observed below a layer of insufficient oxygen ( $<4 \mathrm{ppm}$ ) during June, July, and August. Dissolved oxygen levels suitable for fish ( $\geq 4 \mathrm{mg} / \mathrm{l}$ ) could generally be found from $0-14 \mathrm{ft}$ deep during the summer months. Lake temperatures peaked during the month of July in the low 80-degree range.

## Guist Creek Lake (317 acres)

Spring nocturnal electrofishing studies were completed for length frequency, CPUE and population assessment for largemouth bass in April 2017 (Table 52). Total largemouth bass catch rate ( $176.3 \mathrm{fish} / \mathrm{hr}$ ) was higher than the lake average of 163.7 fish $/ \mathrm{hr}$ (Table 53). The PSD for largemouth bass was 65 compared to the lake average of 66 (Table 54). The $\mathrm{RSD}_{15}$ was 43 compared to the lake average of 41 . The population assessment gave a rating of "Excellent", an above average rating observed at Guist Creek Lake (Table 55). Fall largemouth bass sampling was conducted for relative weights, age and growth, and index of year class strength at age-0 and age-1 (Tables 56-59). Relative weights indicated good body condition for bass, especially for bass over 15.0 in (Table 58). Mean length of age-0 largemouth bass ( 5.0 in ) was significantly larger than in recent years and catch rate of age-0 largemouth bass ( $75.3 \mathrm{fish} / \mathrm{hr}$ ) was higher than the average recruitment (avg. $=47.3 \mathrm{fish} / \mathrm{hr}$; Table 59). Therefore, largemouth bass were not stocked into Guist Creek Lake in 2017.

Gill netting was completed in October for hybrid striped bass (Table 60). Four nets were fished for two nights ( 8 net-nights) in similar sites as in past years. A total of 48 hybrid striped bass were captured compared to 31 in 2014, 51 in 2011, 32 in 2010 and 26 in 2009. Age and growth studies were completed using otoliths. Calculations indicated hybrid striped bass continued to reach 15.0 in between age 1 and age 2, and 20.0 in between age 2 and age 3 (Tables 61-62). Relative weights of these hybrid striped bass continue to be below average ( $\mathrm{W}_{\mathrm{r}}=83$ ) for their size (Table 63). The population assessment indicated a rating of "Poor", below the average population rating of "Fair" for Guist Creek Lake (Table 64). Guist Creek Lake was stocked with 19,098 (60.2 fish/acre; 1.6 in) hybrid striped bass in June 2017

Saugeye were collected during the spring largemouth bass sample (Table 52). Sampling yielded 32 saugeye (10.7 fish $/ \mathrm{hr}$ ) ranging in size from the 8.0 - to 23.0 -in size class. Additionally, saugeye were collected during fall electrofishing (Table 65). Sampling yielded 37 saugeye ( $24.7 \mathrm{fish} / \mathrm{hr}$ ) ranging in size from the 8.0 - to 24.0 -in size class. Gill netting for 8 net-nights was completed in October for saugeye (Table 60). A total of 123 saugeye were captured from the 9.0 - to 24.0 -in classes. Age and growth studies were completed using otoliths. Calculations indicated that on average saugeye reach 15.0 in between age 1 and age 2, and 20.0 in by age 3 (Tables 66). All five
stocked year classes were represented in this sample (Table 67). Guist Creek Lake was stocked with 15,850 (50.0 fish/acre; 1.8 in ) saugeye in 2017. This was the fifth year of saugeye stocking into Guist Creek Lake.

Guist Creek Lake was stocked with 3,167 (10.0 fish/acre; 5.0-10.0 in) channel catfish in March 2017.

## A.J. Jolly Lake (175 acres)

Spring diurnal electrofishing was completed in April 2017 to assess the black bass population (Table 68). Results indicated largemouth bass catch rates ( 131.6 fish $/ \mathrm{hr}$ ) were greater than the lake's historical average ( 85.5 fish $/ \mathrm{hr}$ ) (Table 69). The PSD for largemouth bass was 48 and the $\mathrm{RSD}_{15}$ was 26 (Table 70). The population assessment indicated a "Good" bass population, the average rating since 2010 (Table 71). Fall diurnal electrofishing was conducted for relative weights and to index year class strength of age-0 largemouth bass in October (Tables 7274). Relative weights indicated acceptable body condition $\left(\mathrm{W}_{\mathrm{r}}=89\right)$ (Table 73). Fall sampling indicated an above average number of age- 0 bass, ( $37.5 \mathrm{fish} / \mathrm{hr}$; average $=24.1 \mathrm{fish} / \mathrm{hr}$ ) and above average size of age- 0 bass ( 5.4 in ; average=4.6 in) (Table 74). Largemouth bass were not stocked during 2017.
A.J. Jolly Lake was stocked with 8,750 (50.0 fish/acre; 1.8 in ) saugeye in 2017. This was the fifth year of saugeye stocking. Saugeye were collected during the spring largemouth bass sample (Table 68). Sampling yielded 42 saugeye ( 16.8 fish $/ \mathrm{hr}$ ) ranging in size from the 7.0 - to 21.0 -in size class. Additionally, saugeye were collected during the fall largemouth bass sample (Table 72). Sampling yielded 74 saugeye ( $37.0 \mathrm{fish} / \mathrm{hr}$ ) ranging in size from the 4.0 - to 23.0 -in size class.

Channel catfish were sampled in October using tandem hoop nets at A.J. Jolly in 2017. Length frequency results for channel catfish showed a size distribution between the 8.0 and 22.0 -in size classes (Table 75). The PSD and $\mathrm{RSD}_{24}$ for channel catfish was 19 and 0 , respectively (Table 76). Relative weights indicated good body condition for channel catfish $\left(\mathrm{W}_{\mathrm{r}}=95\right)$ (Table 77). Overall, catch rates at A.J. Jolly remain lower than the lake average of $38.3 \mathrm{fish} / \mathrm{hr}$ (Table 78). A.J. Jolly Lake was stocked with 1,750 (10.0 fish/acre; $5.0-10.0 \mathrm{in}$ ) channel catfish in March 2017.

On May 31, 2017 a total of 218 common carp were removed from AJ Jolly Lake. The average weight of a common carp removed from AJ Jolly Lake was 3.3 lbs . Therefore, it was estimated that 720 lbs of common carp were removed from AJ Jolly Lake. The seven-year total for common carp removed from AJ Jolly Lake is 1,954 fish at an estimated weight of $6,266.7 \mathrm{lbs}$ ( 3.2 lbs average weight per fish).

A creel survey conducted during 2016 and 2017 by the AJ Jolly Nature Resource Committee resulted in 30 completed creel cards. From this very small sample size, the average trip length was 4.5 hrs with $55 \%$ of anglers fishing from a boat and $45 \%$ of anglers' bank fishing. The most sought after species was catfish (40\%) followed by fishing for anything (33\%).

An angler attitude survey was conducted at AJ Jolly Lake through both an online survey during 2016 and an onsite survey conducted in both 2016 and 2017 by the AJ Jolly Nature Resource Committee in conjunction with the Campbell County Fiscal Court. A total of 92 surveys were completed. The survey reflected that $60.5 \%$ of all anglers were satisfied with the fishing at AJ Jolly compared to the $14.2 \%$ of anglers that were dissatisfied. Overall, $94.1 \%$ of anglers were satisfied with the current size and creel limits. The majority of anglers (58.5\%) stated that they would prefer AJ Jolly to be managed for a balanced bass and bluegill fishery. Seventy-four percent of anglers are satisfied with the current facilities at AJ Jolly compared to $3.5 \%$ of anglers that were dissatisfied.

## Beaver Lake (158 acres)

During March, April, and June, an effort was made to reduce the crowded largemouth bass population at Beaver Lake. Two thousand three hundred eighty-seven ( 2,387 ; 15.1 fish/acre) largemouth bass were removed from Beaver Lake during three separate events with fish transported to Boltz, Kinman, Taylorsville, and 4 FINS lakes. Largemouth bass ranging in size from 4.0 to 13.0 in ( $<8.0$ in $=1,758$ ( $73.6 \%$ ); 8.0-10.9 in $=439$ ( $18.4 \%$ ); 11.0-13.0 in $=190(8.0 \%))$ were removed from Beaver Lake.

A spring diurnal electrofishing sample was completed in April 2017 to assess the black bass population (Table 79). The CPUE for all sizes was $480.0 \mathrm{fish} / \mathrm{hr}$, greater than the lake average of $249.9 \mathrm{fish} / \mathrm{hr}$ (Table 80). The PSD and $\mathrm{RSD}_{15}$ for largemouth bass were 20 and 2, respectively, compared to the current lake average of 28 and 4 (Table 81). The population assessment score indicated a "Good" bass population (Table 82), which is the average assessment rating for Beaver Lake. Fall diurnal electrofishing was conducted for relative weights and the index of age- 0 year class strength (Tables $83-85$ ). The relative weight index continues to reflect below expected average weights for most length groups of largemouth bass $\left(\mathrm{W}_{\mathrm{r}}=83\right)$; which is lower than the lake average of 85 (Table 84). Fall sampling indicated above average numbers of age-0 bass, ( $227.3 \mathrm{fish} / \mathrm{hr}$; average $=130.7 \mathrm{fish} / \mathrm{hr}$ ) and the average size of largemouth bass ( 4.8 in ) was higher than the lake's average of 4.2 in (Table 85).

Spring diurnal electrofishing was completed in March and May 2017 to assess the panfish populations; however, only the May sampling results were used in the assessment tables to remain consistent with reported historical data (Tables 86-92). Length frequency results showed the majority of bluegill were in the 6.0 - to 7.0 -in range (Table 86). The PSD for bluegill was 66 compared to the lake average of 31 (Table 88). The RSD 8 was 4, compared to the lake average of 1. CPUE for all length groups of bluegill was $402.4 \mathrm{fish} / \mathrm{hr}$; considerable higher than the lake average of 250.5 fish/hr (Table 89). Redear sunfish PSD and RSD 9 were 74 and 37, respectively (Table 88). The population assessment for bluegill indicated an "Excellent" population rating, which is above average for Beaver Lake (Table 90). The catch rate of redear sunfish $\geq 8.0$ in was 7.2 fish $/ \mathrm{hr}$ and was significantly lower than the lake average of 23.4 fish $/ \mathrm{hr}$ (Table 91). Additionally, catch rates for all sizes were significantly lower than the lake's average catch rate ( 68.5 fish $/ \mathrm{hr}$ ) for all sizes. The population assessment indicated an "Excellent" redear sunfish fishery (Table 92). Age and growth studies on bluegill and redear sunfish showed that bluegill reach 6.0 in and redear sunfish reach 8.0 in between age 2 and 3 (Table 93-94). Relative weights for bluegill and redear sunfish were collected during the fall diurnal electrofishing sample. Overall, relative weight data for bluegill was fair to poor while the body condition of redear sunfish was good (Table 95). A total of 31,800 (201.3 fish/acre; 1.02.0 in) redear sunfish were stocked during September 2017.

Diurnal electrofishing studies to evaluate the crappie population were completed at Beaver Lake in October 2017. A total of 10 crappie ( 7 black crappie and 3 white crappie) were collected in 1.5 hr of electrofishing (Table 96).

Channel catfish were sampled in October 2017 using tandem hoop nets. Length frequency results for channel catfish showed a size distribution between the 12.0 and 24.0 -in size classes (Table 97). The PSD and RSD $_{24}$ for channel catfish was 65 and 1, respectively (Table 98). Relative weights indicated fair body condition for channel catfish $\left(\mathrm{W}_{\mathrm{r}}=87\right)$, which was lower than the average for the lake $\left(\mathrm{W}_{\mathrm{r}}=88\right)($ Table 99). Overall, catch rates at Beaver Lake remain lower than the lake average of 44.7 fish $/ \mathrm{hr}$ (Table 100).

Beaver Lake was scheduled to be lowered about 8 feet from November 2017-February 2018 in an effort to crowd the fish, assist with a habitat placement and allow for winter rye to be planted on the exposed shoreline. A total of $1,550 \mathrm{lbs}$ of winter rye was planted, which should assist in suspending nutrients and providing additional shoreline fish habitat. However, a malfunction occurred with the valve on the control structure resulting in the valve being closed in December 2017. At that point the lake was down 3.5 feet returning to normal pool by the first week of February.

No applications of aquatic herbicides were completed at Beaver Lake in 2017. No liquid fertilizer applications have been made since 2001. Finally, no gizzard shad were collected at Beaver Lake in 2017.

## Benjy Kinman Lake (88 acres)

A spring nocturnal electrofishing sample was completed in April 2017 to assess the black bass population (Table 101). The CPUE for all sizes was 120.0 fish $/ \mathrm{hr}$, compared to the lake average of 124.5 fish $/ \mathrm{hr}$ (Table 102). The PSD and $\mathrm{RSD}_{15}$ for largemouth bass were 29 and 5, respectively (Table 103). The population assessment score indicated a "Fair" bass population (Table 104). Fall largemouth bass sampling was conducted for relative weights, age and growth, and index of year class strength at age-0 and age-1 in September 2017 (Tables 105-108). Relative weights indicated below average body condition for bass $\left(\mathrm{W}_{\mathrm{r}}=84\right)$ with larger fish exhibiting better condition compared to smaller length groups (Table 106). The better condition of larger fish is due to the gizzard shad forage
base. Age and growth studies on largemouth bass show that largemouth bass reach 12.0 in between age 3 and 4 (Table 107). CPUE for both age- 0 and age- $0 \geq 5.0$ in were collected for the fourth time at Benjy Kinman Lake (Table 108). Largemouth bass (140 fish; 11.0-13.0 in) removed from Beaver Lake were stocked into Benjy Kinman Lake in March 2017.

Diurnal electrofishing studies to evaluate the crappie population were completed in October 2017. A total of 24 crappie ( 2 white crappie and 22 black crappie) were collected in 1.5 hrs of electrofishing (Table 109). Age and growth studies of white crappie indicated they reach 9.0 in between age 3 and 4 (Table 110). Additionally, age and growth studies showed black crappie growth to be slow (Table 111). Relative weights indicated below average body condition for both white crappie $\left(\mathrm{W}_{\mathrm{r}}=87\right)$ and black crappie $\left(\mathrm{W}_{\mathrm{r}}=81\right)($ Table 112 $)$.

Benjy Kinman Lake was stocked with 880 (10.0 fish/acre; 5.0-15.0 in) channel catfish in February 2017.
A total of eighteen rough fish removal events took place from May 2017- March 2018 resulting in a total of 922 bigmouth buffalo, smallmouth buffalo, common carp, river carpsucker, and longnose gar being removed from Benjy Kinman Lake. The average weight of removed rough fish was 8.3 lbs . Therefore, it was estimated that 7,670 lbs of rough fish were removed from Benjy Kinman Lake. The four-year total for rough fish removed from Benjy Kinman Lake is 3,390 fish at an estimated weight of $24,226 \mathrm{lbs}$ ( 7.1 lbs average weight per fish).

A soil test was completed during the fall at Kinman Lake that resulted in a soil pH level of 5.3. Based on the pH it was recommended to apply 5 tons/acre of agricultural lime. Therefore, during December 121 tons of agricultural lime was washed into the upper third of Kinman Lake. Additional liming is planned for the remainder of the lake next year.

Kinman Lake was lowered 2 feet from October 2017-February 2018 in an effort to crowd the fish, assist with rough fish removal and allow for winter rye to be planted on the exposed shoreline. A total of 650 lbs of winter rye was planted, which should assist in suspending nutrients as it decomposes while providing additional shoreline fish habitat.

## Boltz Lake (92 acres)

Spring nocturnal electrofishing was completed in April 2017 to assess the black bass population (Table 113). Results indicated largemouth bass catch rates ( 218.5 fish $/ \mathrm{hr}$ ) were higher than the lake's historical average (192.0 fish/hr; Table 114). The PSD for largemouth bass was 30 compared to the lake average of 43 (Table 115). The $\operatorname{RSD}_{15}$ was 9 , lower than the lake average of 17 . The population assessment indicated a "Good" bass population (Table 116). Fall diurnal electrofishing was conducted for length frequency, relative weights and index of age-0 year class strength in September (Tables 117-119). Relative weights indicated acceptable body condition $\left(\mathrm{W}_{\mathrm{r}}=91\right)$, higher than the lake's average relative weight of 90 (Table 118). Fall sampling indicated above average numbers of age- 0 bass, ( $164.0 \mathrm{fish} / \mathrm{hr}$; average $=58.1 \mathrm{fish} / \mathrm{hr}$ ) and the average size ( 4.3 in ) was comparable to the lake's average size of 4.2 in (Table 119). Largemouth bass were stocked in Boltz Lake from a bass removal project completed at Beaver Lake during March 2017. A total of 629 largemouth bass ( 6.8 fish/acre) were stocked that ranged from the 4.0 - to 10.0 -in size class.

Saugeye were collected during the spring largemouth bass sample (Table 113). Sampling yielded 23 saugeye ( 11.5 fish $/ \mathrm{hr}$ ) ranging in size from the 10.0 - to 15.0 -in size class. Saugeye were stocked into Boltz Lake for the third time during 2017. A total of 4,600 saugeye ( 50.0 fish/acre) were stocked at an average size of 1.8 in .

Fall relative weight index reflected average condition for bluegill $\left(\mathrm{W}_{\mathrm{r}}=89\right.$; lake average $\left.\mathrm{W}_{\mathrm{r}}=90\right)($ Table 120).

Redear sunfish (18,400 fish; 200.0 fish/acre) were stocked in September 2017 that averaged 1.0-2.0 in.
Boltz Lake was stocked with 2,158 (23.5 fish/acre; 5.0 - 10.0 in) channel catfish in 2017.

A total of 16 common carp averaging $9.63 \mathrm{lbs} /$ fish were removed from Boltz Lake in June 2017. In total, 573 common carp (estimated 4,654 lbs) have been removed from Boltz Lake since 2008.

Currently, Boltz Lake does not have a population of gizzard shad.

## Bullock Pen Lake (134 acres)

Spring nocturnal electrofishing was completed in May 2017 to assess the black bass population (Table 121). The total catch rate of largemouth bass ( $204.5 \mathrm{fish} / \mathrm{hr}$ ) was much higher than the lake's average catch rate of 140.2 fish $/ \mathrm{hr}$ (Table 122). The PSD for largemouth bass was 78, higher than the lake average of 70 (Table 123). The $\mathrm{RSD}_{15}$ for largemouth bass was 42 , higher than the lake average of 40 . The population assessment for largemouth bass was rated "Good"; the same rating since 2012 (Table 124). Fall diurnal electrofishing was conducted in September to determine for length frequency, relative weights and index of age-0 year class strength for largemouth bass (Tables 125-127). Relative weights indicated acceptable body condition for bass ( $\mathrm{W}_{\mathrm{r}}=92$ ), but were lower than the lake's average $\left(\mathrm{W}_{\mathrm{r}}=94\right)$. Larger fish exhibited better condition compared to smaller length groups, which is a function of the shad forage base (Table 126). Age-0 CPUE ( $32.7 \mathrm{fish} / \mathrm{hr}$ ) was higher than the lake average ( $21.1 \mathrm{fish} / \mathrm{hr}$ ); therefore, no largemouth bass were stocked in 2017 (Table 127).

Saugeye were collected during the spring largemouth bass sample. Twelve saugeye ( $6.0 \mathrm{fish} / \mathrm{hr}$ ) were collected ranging in size from the 15.0 - to 21.0 -in class (Table 121).

Bullock Pen Lake was stocked with 2,196 (16.4 fish/acre; 5-10 in) channel catfish in March 2017.

During 2017, KDFWR was able to purchase and take sole ownership of the property adjacent to the boat ramp at Bullock Pen Lake.

## Corinth Lake (96 acres)

Spring nocturnal electrofishing was completed in April 2017 to assess the black bass population (Table 128). The total catch rate of largemouth bass ( $380.5 \mathrm{fish} / \mathrm{hr}$ ) was higher than the lake's average catch rate of 241.9 fish $/ \mathrm{hr}$ (Table 129). The PSD for largemouth bass was 17 , lower than the lake average of 21 (Table 130). The $\mathrm{RSD}_{15}$ for largemouth bass was 8 , equal to the lake average. The population assessment for largemouth bass was rated "Good"; the average rating since 2005 (Table 131). Fall diurnal electrofishing for largemouth bass was conducted to determine length frequency, year class strength and relative weight (Tables 132-134). Relative weights of largemouth bass continue to be below average, except for largemouth bass $\geq 15.0$ in. The overall relative weight in $2017\left(\mathrm{~W}_{\mathrm{r}}=82\right)$ was less than the average relative weight observed at Corinth Lake ( $\mathrm{W}_{\mathrm{r}}=84$; Table 133). The year class strength model indicated that 2017 was a below average recruitment year for young-of-year largemouth bass (Table 134). Age-0 CPUE ( 35.3 fish/hr) remained below the lake average ( 87.9 fish $/ \mathrm{hr}$ ); however, largemouth bass were not stocked into Corinth Lake in 2017.

Spring diurnal electrofishing for bluegill and redear sunfish was completed in May 2017 to obtain length frequency, CPUE and population assessment data (Table 135). Bluegill PSD (65) was significantly higher than the lake average of 32 (Table 136). The bluegill catch rate ( $264.0 \mathrm{fish} / \mathrm{hr)} \mathrm{continued} \mathrm{to} \mathrm{increase} \mathrm{and} \mathrm{was} \mathrm{higher} \mathrm{than} \mathrm{the}$ lake's average ( 239.6 fish $/ \mathrm{hr}$; Table 137). The population assessment indicated a "Good" population, which is the average rating (Table 138). The redear sunfish catch rate ( $203.2 \mathrm{fish} / \mathrm{hr}$ ) continued to increase and was higher than the lake's average ( $73.3 \mathrm{fish} / \mathrm{hr}$; Table 139). Redear sunfish PSD was 64 , higher than the lake average of 56 (Table 136). Catch rate for redear sunfish $\geq 8.0$ in was 43.2 fish $/ \mathrm{hr}$; remaining higher than the lake average of $29.8 \mathrm{fish} / \mathrm{hr}$ (Table 139). The population assessment for redear sunfish continues to be rated as "Good" (Table 140). Relative weights indicated fair condition for bluegill (89) and good condition for redear sunfish (93; Table 141).

Channel catfish were sampled in October at Corinth Lake using tandem hoop nets. Length frequency results for channel catfish showed a size distribution between the 9.0 and 23.0-in size classes (Table 142). The PSD and $\mathrm{RSD}_{24}$ for channel catfish was 21 and 0 , respectively (Table 143). Relative weights indicated "Good" body condition for channel catfish $\left(\mathrm{W}_{\mathrm{r}}=92\right)($ Table 144). Overall, catch rates at Corinth Lake remain lower than the lake
average of 53.4 fish $/ \mathrm{hr}$ (Table 145). Corinth Lake was stocked with 1,275 (20.3 fish/acre; 5.0-10.0 in) channel catfish in March 2017.

One hundred gallons of fertilizer was applied in May 2017.

## Elmer Davis Lake (149 acres)

Spring diurnal electrofishing studies were conducted in April 2017 for PSD, length frequency and CPUE for largemouth bass (Table 146). The total catch rate ( $279.5 \mathrm{fish} / \mathrm{hr}$ ) was lower than the historical lake average of 306.4 fish $/ \mathrm{hr}$ (Table 147). Largemouth bass PSD and $\mathrm{RSD}_{15}$ were $59($ average $=30)$ and 14 (average $=8$ ), respectively (Table 148). The population assessment indicated an "Excellent" bass population, better than the tenyear average rating of "Good" (Table 149). Fall electrofishing evaluated largemouth bass relative weight and index of year class strength (Tables 150-152). Largemouth bass relative weight $\left(\mathrm{W}_{\mathrm{r}}=86\right)$ was less than the historical lake average $\left(\mathrm{W}_{\mathrm{r}}=87\right.$; Table 151). The year class strength model indicated that 2017 was an above average year for young-of-year largemouth bass. Age-0 CPUE ( $366.4 \mathrm{fish} / \mathrm{hr}$ ) was higher than the lake average ( $142.7 \mathrm{fish} / \mathrm{hr}$ ) (Table 152).

Diurnal spring electrofishing for length frequency, CPUE, and population assessment were conducted for bluegill and redear sunfish in May 2017 (Table 153). The total bluegill catch rate ( $194.4 \mathrm{fish} / \mathrm{hr}$ ) remains lower than the lake average of $255.9 \mathrm{fish} / \mathrm{hr}$ (Table 155). The PSD value for bluegill (54) was higher than the lake average of 35 (Table 154). Likewise, the $\mathrm{RSD}_{8}$ (1) remains lower than the lake average of 2. The population assessment for bluegill was "Fair", the average rating since 2009 (Table 156). The total catch rate of redear sunfish ( $48.0 \mathrm{fish} / \mathrm{hr}$ ) was lower than the lake average of $71.3 \mathrm{fish} / \mathrm{hr}$ (Table 157). The PSD for redear sunfish was 98 compared to the lake average of 55. The $\mathrm{RSD}_{9}$ was 18 compared to the lake average of 17 (Table 154). The redear sunfish population assessment indicated a "Good" population, which is equal to the average lake rating (Table 158). Relative weight index reflects average condition for both bluegill $\left(\mathrm{W}_{\mathrm{r}}=95\right)$ and redear sunfish $\left(\mathrm{W}_{\mathrm{r}}=96\right)$; however both species are below the lake averages of 96 and 102, respectively (Table 159). A total of 36,300 (243.6 fish/acre; 1.0-2.0 in) redear sunfish were stocked during September 2017

Elmer Davis Lake was stocked with 3,290 (22.1 fish/acre; 7.0-10.0 in) channel catfish in March 2017.
The shad eradication project completed in December 2016 appears to have been successful. Multiple shocking events have been completed specifically looking for gizzard shad, including standard sampling, which have resulted in no gizzard shad being detected. This will continue to be monitored during 2018.

KDFWR Engineering Division attempted to pump grout into the hillside at the site of a leak discovered in the cove adjacent to the dam ramp. After refilling, it appears that the grouting made little or no impact on the leak. This leak will continue to be monitored.

## Kincaid Lake (183 acres)

Spring nocturnal electrofishing studies were conducted in April 2017 for PSD, length frequency and CPUE for largemouth bass (Table 160). Total catch rate ( 221.0 fish $/ \mathrm{hr}$ ) was higher than the lake average of $216.1 \mathrm{fish} / \mathrm{hr}$ (Table 161). Largemouth bass PSD and $\mathrm{RSD}_{15}$ were 79 (average $=68$ ) and 53 (average $=44$ ), respectively (Table 162). The population assessment indicated an "Excellent" bass population (Table 163). Fall diurnal electrofishing for relative weights, age and growth and index of year class strength at age 0 were conducted in September (Tables 164-167). Largemouth bass growth rates at Kincaid Lake indicated bass are reaching harvestable size (12.0 in) between age 3 and age 4 (Table 165). Additionally, largemouth bass were reaching 15.0 in between age 5 and age 6 . Relative weights of largemouth bass length groups were about average for Kincaid Lake ( $2017 \mathrm{~W}_{\mathrm{r}}=93$; lake average $=92$ ) $($ Table 166). Age-0 CPUE ( $29.3 \mathrm{fish} / \mathrm{hr)}$ ) was lower than the lake average ( $37.3 \mathrm{fish} / \mathrm{hr}$ ) (Table 167). Largemouth bass were not stocked into Kincaid Lake in 2017.

Channel catfish were sampled in October using tandem hoop nets at Kincaid Lake. Channel catfish collected were distributed from the 8.0 - to 24.0 -in size classes (Table 168). Channel catfish were collected at 71.3
fish/set-night in 2017, which is higher than the lake average of 62.0 fish/set-night (Table 169). The PSD and $\mathrm{RSD}_{24}$ for channel catfish were 33 and 2, respectively (Table 170). Relative weights of channel catfish were acceptable $\left(\mathrm{W}_{\mathrm{r}}=90\right)($ Table 171). Kincaid Lake was stocked with 2,427 (13.3 fish/acre; 5.0-10.0 in) channel catfish in March 2017.

## McNeely Lake (51 acres)

Diurnal fall electrofishing for largemouth bass in October 2017 was completed to collect length frequency and relative weight values (Table 172). Relative weights were at acceptable levels ( $\mathrm{W}_{\mathrm{r}}=88$ ), just below the lake average ( $\mathrm{W}_{\mathrm{r}}=89$; Table 173). CPUE for age-0 bass ( 177.6 fish $/ \mathrm{hr}$ ) was higher than the lake average of 123.2 fish $/ \mathrm{hr}$ (Table 174). Largemouth bass were not stocked into McNeely Lake in 2017.

Bluegill and redear sunfish were sampled in May 2017 for length frequency, CPUE and population assessment (Table 175). Catch rate for bluegill ( 260.8 fish $/ \mathrm{hr}$ ) was lower than the lake average catch rate of 336.0 fish $/ \mathrm{hr}$ (Table 177). The bluegill PSD was 66 compared the lake average of 40 (Table 176). $\mathrm{RSD}_{8}$ was 2 , compared to the lake average of 0.4. The population assessment for bluegill has remained "Excellent" since 2013 (Table 178). The total catch rate for redear sunfish ( $74.4 \mathrm{fish} / \mathrm{hr}$ ) was higher than the lake average ( $56.6 \mathrm{fish} / \mathrm{hr}$; Table 179). The PSD for redear sunfish was 61 compared to the lake average of 46 and the $\mathrm{RSD}_{9}$ was 9 compared to the lake average of 8 (Table 176). The redear sunfish fishery was rated "Good", which has been the average rating since 2005 (Table 180). Relative weights and age and growth for bluegill and redear sunfish were collected during the fall diurnal electrofishing sample. Age and growth studies showed that bluegill continue to reach 6.0 in between age 2 and 3 (Table 181). Redear sunfish reach 6.0 in between age 1 and 2, and 8.0 in by age 3 (Table 182). Overall, condition for both bluegill (96) and redear sunfish (98) was good (Table 183).

Channel catfish were not sampled at McNeely Lake in 2017. McNeely Lake was stocked with 1,275 (25.0 fish/acre; 5.0-10.0 in) channel catfish in March 2017.

Currently, McNeely Lake does not contain a population of gizzard shad.

## Lincoln Homestead Lake

Length frequency, relative abundance and CPUE of fish collected by electrofishing at Lincoln Homestead Lake (Washington Co.) in April 2017 are shown in Table 184. Largemouth bass were collected from the 4.0- to 15.0 -in size classes and bluegill from the 3.0 - to 8.0 -in size classes. Trophy size ( $\geq 10.0 \mathrm{in}$ ) redear sunfish were sampled, with crappie present up to 12.0 in .

## Reformatory Lake

Length frequency, relative abundance and CPUE of fish collected by electrofishing at Reformatory Lake (Oldham Co.) in May 2017 are shown in Table 185. Largemouth bass were collected from the 3.0- to 20.0-in size classes, bluegill from the 3.0 - to 7.0 -in size classes and redear sunfish from the 4.0 - to 10.0 -in size classes. Other species observed included white crappie, black crappie, yellow bass, channel catfish and flathead catfish.

Reformatory Lake was stocked with 1,047 (19.4 fish/acre; 5.0-15.0 in) channel catfish in February 2017.

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body | Species | Date | Time (24hr) | Gear | Weather | Water temp. F | Water level | Secchi (in) | Conditions | Pertinent sampling comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Beaver Lake | BLG/RES | 3/29 | 1000 | shock | Overcast/light breeze | 55 | Full | 54 | good | good sample |
| Lincoln Homestead | LMB/BLG/RES | 4/5 | 1030 | shock | --- | -- | Full | --- | Good | good sample |
| Herrington Lake (Cane Run) | Black Bass | 4/11 | 1030 | shock | Cloudy/light breeze | 61 | 733.34 | 42 | good | good sample |
| Benjy Kinman Lake | LMB | 4/11 | 1800 | Shock | --- | 60 | Full | 38 | good | nocturnal sample |
| Herrington Lake (Gwinn Island) | Black Bass | 4/12 | 1000 | shock | Mostly sunny/cool | 62 | 733.34 | 30 | good | good sample |
| Herrington Lake (Kings Mill) | Black Bass | 4/17 | 1030 | shock | Cloudy/calm winds | 68 | 733.34 | 38 | good | good sample |
| Guist Creek Lake | LMB/Saugeye | 4/17 | 1030 | shock | --- | 68 | High | 26 | good | lake above normal/debris |
| Beaver Lake | LMB | 4/18 | 1030 | shock | Overcast/breezy | 65 | Full | 73 | good | good |
| Boltz Lake | LMB/Saugeye | 4/18 | 1800 | shock | Calm/clear | 68 | Full | 60 | good | nocturnal sample |
| Elmer Davis Lake | LMB | 4/19 | 1030 | shock | Partly sunny/breezy | 69 | $\sim 6 \mathrm{ft}$ low | 39 | good | lake level low due to drawdown for shad eradication complete in December, lake refilling |
| AJ Jolly Lake | LMB/Saugeye | 4/19 | 1030 | shock | Cloudy | 66 | Full | 6 | muddy | FINS sampled |
| Kincaid Lake | LMB | 4/20 | 1100 | shock | Mostly cloudy | 70 | Full | 23 | good | good sample |
| Taylorsville Lake (Van Buren) | LMB | 4/24 | 1030 | shock | Clear/sunny | 68 | 547.2 | 27 | good | good sample |
| Corinth Lake | LMB | 4/25 | 1800 | shock | Clear | 66 | Full | 72 | good | nocturnal sample/ filamentous algae very abundant |
| Taylorsville Lake (Ashes/Jacks) | LMB | 4/25 | 1030 | shock | Partly cloudy/light winds | 65 | 547.0 | 60 | good | good sample |
| Taylorsville Lake (Big Beech) | LMB | 4/26 | 1030 | shock | High clouds/breezy | 69 | 547.0 | 40 | good | good sample |
| Bullock Pen Lake | LMB/Saugeye | 5/1 | 1030 | shock | Mostly cloudy/very windy | 69 | Full/Spilling | 22 | good | good sample |
| Reformatory Lake | LMB/BLG/RES | 5/2 | 1030 | shock | Mostly sunny/very windy | 64 | Full/Spilling | 22 | stained | good sample |
| Beaver Lake | BLG/RES | 5/15 | 1030 | shock | Sunny/calm | 74 | Full | 60 | good | good sample |

# Kentucky Department of Fish and Wildlife Resources 

## AJ JOLLY LAKE ANGLER ATTITUDE SURVEY 2016 and 2017

(Based on 92 surveys)

1. Have you completed this survey this year? $\mathbf{1 4 . 1 \%}$ Yes $85.9 \%$ No
2. In general, what level of satisfaction or dissatisfaction do you have with fishing at AJ Jolly Lake? ( $n=91$ )
23.1\% Very satisfied $\mathbf{3 7 . 4 \%}$ Somewhat satisfied $\mathbf{2 5 . 3 \%}$ Neutral 9.9\% Somewhat dissatisfied 4.3\% Very dissatisfied

2a. If you responded with very or somewhat satisfied in question (2) - What is the single most important reason for your Satisfaction? ( $\mathrm{n}=69$ )
 18.8\% Other (close to home, campground, shoreline access, species variation, balanced lake, pleasant atmosphere)

2b. If you responded with somewhat or very dissatisfied in question (2) - What is the single most important reason for your Dissatisfaction? ( $n=14$ )
85.7\% Number of fish $14.3 \%$ Size of fish
3. Are you satisfied with the current size limits and creel limits at AJ Jolly Lake? ( $n=85$ )

## 94.1\% Yes $\mathbf{5 . 9 \%}$ No

If not, what would you prefer (not sure what the size limits are currently, just not great fishing)
4. In general, what level of satisfaction or dissatisfaction do you have with the current facilities, boat ramp and courtesy dock at AJ Jolly Lake? ( $\mathrm{n}=87$ )
44.8\% Very satisfied $\quad \underline{28.7 \%}$ Somewhat satisfied $\quad \underline{23.0 \%}$ Neutral $\quad$ 3.5\% Somewhat dissatisfied 0\% Very dissatisfied
5. If you were able to choose the type of fisheries management at A.J. Jolly Lake, which of the following scenarios would be your number one choice? ( $\mathrm{n}=89$ )
11.2\% High numbers of small bluegill ( $3-5$ inches) and low numbers of quality bass ( $13-20$ inches), which could be hard to catch at times. (Quality Bass Management)
58.5\% Average numbers of quality bluegill (hand-sized) and average numbers of quality bass ( $8-14$ inches)l (Balanced Bass and Bluegill Management)
11.2\% High numbers of smaller easily caught bass (generally under the 12 inch size limit) and lower numbers of quality bluegill (hand-size or bigger) (Quality Bluegill Management)
19.1\% Don't fish for bass or bluegill or No Opinion

Table 79. Length frequency, relative abundance, and CPUE (fish/hr) of largemouth bass collected in 2.0 hours of 15-minute electrofishing runs in Beaver Lake, April 2017; numbers in parentheses are standard errors.

| Species | Inch class |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | Total | CPUE |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

# NORTHEASTERN FISHERY DISTRICT 

## Project 1: Lake and Tailwaters Fishery Surveys

## FINDINGS

All sampling conditions can be found in Table 1. This includes dates, temperatures, secchi depths and any other pertinent sampling information during the sampling events.

## Cave Run Lake (8,720a)

Muskellunge sampling
On March 27-29, the upper, middle and lower sections of Cave Run Lake were sampled for an assessment of the muskellunge fishery. In total, 170 fish were collected; of those, 69 ( $41 \%$ ) came from the lower section, 62 ( $36 \%$ ) came from the middle section, and 39 ( $23 \%$ ) came from the upper section (Table 2). Relative weights continue to be in the upper $80 \%$ to lower $90 \%$ range and show very little statistical difference to relative weights obtained prior to the implementation of the 36.0 -in minimum size limit (Table 3). Once again, average length and weight of knownage fish was determined from marked members of the population. In Cave Run Lake, the fish tend to reach the minimum size limit of 36.0 inches in their fourth year (Table 4). In 2017, the fishery overall was rated as "Excellent" with a score of 17 ; this brings us back to more normal levels after a slight drop in 2016 (Table 5). In October of 2016, Cave Run Lake was stocked with 2,700 young-of-year muskellunge. Stocked fish continue to be marked to indicate their spawning year as noted in the table below.

| Year | Marking | Number <br> stocked | Average <br> length |
| :---: | :---: | :---: | :---: |
| 2017 | Caudal wire tag | 2,700 | 12.0 in |
| 2016 | Right cheek wire tag | 2,800 | 11.8 in |
| 2015 | Dorsal fin wire tag | 1,307 | 13.0 in |
| 2014 | Left cheek wire tag | 2,900 | 13.3 in |
| 2013 | Right pectoral fin clip | 2,800 | 12.6 in |
| 2012 | Left pelvic fin clip | 1,923 | 12.4 in |
| 2011 | Right pelvic fin clip | 2,800 | 12.8 in |
| 2010 | Left pectoral fin clip | 2,811 | 12.5 in |

Black bass sampling (Spring/Fall)
On April 17-19, the upper, middle and lower sections of Cave Run Lake were nocturnally electrofished for assessment of the black bass population. In total, 1,710 fish were captured. The majority of these fish were largemouth bass ( $64 \%$ ), followed by spotted bass ( $33 \%$ ), and smallmouth bass ( $3 \%$; Table 6). As is normally the case, the percentage of the population represented by spotted and smallmouth bass increases as you head from the upper sections of the lake to the lower sections of the lake. Catch rates were higher than the 1990-2016 average for all length groups of largemouth bass with the exception of the fish over 20.0 in, which was statistically identical to the 1990-2016 average (Table 7). PSD and $\mathrm{RSD}_{15}$ values for largemouth bass demonstrate that the majority of the fish in the lake are below 12.0 in (Table 8). PSD and $\mathrm{RSD}_{15}$ values were very similar to values obtained in 2016 ( 2016 values: $\mathrm{PSD}=47, \mathrm{RSD}_{15}=13$ ). Overall, the largemouth bass population was rated as "Excellent"; boosted by continued high scores for catch rates of fish in the 12.0 - to 14.9 -in range, the greater than 15.0 -in range, the greater than 20.0 -in range and the catch rates of age- 1 fish (Table 9).

In October, spotted bass were collected for determination of age and growth characteristics, which allows for an assessment of this fishery in the lake. Spotted bass in Cave Run Lake show slow growth rates with an average length of age-3 fish of 9.7 in (Table 10). Furthermore, some individuals can reach 12.0 in by their sixth year at the earliest, but most are later than that. The overall assessment of this fishery is "Fair" (Table 11). The spotted bass fishery on Cave Run Lake tends to exhibit similar characteristics as the largemouth bass population (i.e.: slow growth and high recruitment).

## White Bass sampling

Over the last week of October, white bass were sampled in the middle and upper reaches of Cave Run Lake with 3panel, 150 -foot experimental gill nets. In 15 net-nights, 288 white bass were collected ranging in size from 6.0 to 15.0 in (Table 12). Relative weights range in the upper 80 to lower 90 percent range, and were slightly lower (but with minimal statistical difference) than the average of the last 4 sampling attempts (2007, 2008, 2011, and 2014; Table 13). White bass were collected for determination of age and growth characteristics and exhibit reasonable growth rates with a mean length at age-2 of 12.2 in and the potential of reaching 15.0 in by their third year (Table 14). The majority of the fish collected were in the 12.0 - to 14.0 -in range and were primarily in their second year (Table 15). The overall assessment of the white bass fishery at Cave Run Lake was "Good" with excellent numbers of fish over 12.0 in (Table 16).

## Grayson Lake (1,512a)

## Black bass sampling (Spring/Fall)

The black bass population of Grayson Lake was nocturnally electrofished from April 24-26. In total, 1,202 fish were collected ranging in size from 3.0 to 20.0 in (Table 17). The majority of these fish ( $85 \%$ ) were largemouth bass and the remainder were spotted bass (15\%). Catch rates by length group were either higher than or not statistically different than the average from 1999-2016 (Table 18). The majority of the population of largemouth bass over 8.0 in is under 12.0 in as demonstrated by PSD values (Table 19). However, PSD and RSD 15 values were very similar to what was obtained in 2016. The overall assessment of the largemouth bass fishery at Grayson Lake was "Good" (Table 20).

In September, Grayson Lake was nocturnally electrofished for collection of fish to determine age and growth characteristics and spawning strength of largemouth bass. Growth rates show slight improvement but remain fair. Generally speaking, it takes a fish 6 years of growth to reach a harvestable size of 15.0 in (Table 21). Growth rates were very similar between different sections of the lake (Table 22). During the sampling period in September, 1,375 total fish were collected ranging in size from 3.0 to 21.0 in (Table 23). Overall, relative weights were in the middle 80 percent range for largemouth bass and the middle section of the lake exhibited some of the better scores (Table 24). Indices of year class strength for largemouth bass continue to be on the high end (Table 25) and the lake was once again not stocked with young of year largemouth bass in 2017

## Lake Carnico (114 a)

## Black bass sampling (Spring/Fall)

On April 12, Lake Carnico was diurnally electrofished to assess the largemouth bass population. A total of 182 fish were collected ranging from 2.0 to 22.0 in (Table 26). The fish in the 12.0 - to 14.9 -in and greater than 15.0 inch classes posted high values and should lead to good numbers of big fish for years to come (Table 27). The PSD and $\mathrm{RSD}_{15}$ values are at an all-time high reflecting the low recruitment the lake has experienced over the last several years (Table 28). The overall largemouth bass assessment was rated as "Good" but has poor catch rates of age-1 fish and fish over 20.0 in (Table 29).

On October 4, Lake Carnico was diurnally electrofished to assess age and growth and relative weights of the largemouth bass population. This sample showed that most bass reached harvestable size ( 15.0 in ) by age 5 with some reaching it at 4 years of age (Table 30). The overall catch rate on this date was $57.3 \mathrm{fish} / \mathrm{hr}$ and largemouth bass caught ranged in size from 2.0 to 20.0 in (Table 31). Relative weights have held steady for the last ten years in the upper 80s to low 90s and this year was not an exception (Table 32).

## Sunfish sampling (Summer)

On May 16, Lake Carnico was diurnally electrofished to assess the sunfish population. A total of 153 bluegill were collected ranging in size from 1.0 to 6.0 in and redear sunfish ranged in size from 3.0 to 7.0 in (Table 33). Bluegill overall numbers are low (nearly a quarter of the 2003-2012 average) and nearly all of the fish caught were in the 3.0 - to 5.9 -in class (Table 34). PSD values also reflected the fact that the majority of the fish in the population were smaller size (Table 35). A subsample of bluegill and redear sunfish were collected from this sampling event to obtain information about the age and growth structure of the populations. Data showed that bluegill growth is slow,
with fish barely exceeding 6.0 in by their $5^{\text {th }}$ year (Table 36). Age frequency shows us that the majority of the fish collected were 2 years old and ranged in size from 3.0 to 5.0 in (Table 37). The bluegill assessment was rated at "Poor" (Table 38). Overall, catch rates of redear sunfish were low (as they historically have been) and data should be interpreted with caution (Table 39). Similar to the bluegill, the majority of the redear collected were smaller (Table 40) and growth rates were slow (Table 41). The majority of the fish collected were 2 and 3 years old ( $33 \%$ and $47 \%$, respectively; Table 42). The overall redear assessment was rated as "Poor" this year (Table 43). Both bluegill and redear are scheduled to be stocked in 2018 in an attempt to rebuild this population.

## Greenbo Lake (181a)

## Black bass sampling (Spring)

On April 20, Greenbo Lake was nocturnally electrofished to assess the largemouth bass population. A total of 301 fish were collected ranging in size from 2.0 to 22.0 in (Table 44). The catch rates of fish in the 12.0 - to $14.9-\mathrm{in}$, over 15.0 -in, and over 20.0 -in classes were all still well above the ten year average (Table 45). PSD and RSD 15 values are still well within the range needed for a balanced population (Table 46). The overall largemouth bass assessment was rated as "Good" with high numbers in the 12.0 - to 14.9 -in and over 20.0-in fish groups (Table 47).

## Sunfish sampling (Spring)

On May 16, Greenbo Lake was diurnally electrofished to assess the sunfish population. A total of 544 bluegill were collected ranging in size from 1.0 to 9.0 in and 61 redear sunfish were captured ranging in size from 2.0 to 11.0 in (Table 48). Overall catch rates of bluegill were on track with the 2007-2016 average (Table 49). PSD and RSD 8 values for bluegill continue to show a balanced population; similar to the largemouth bass population (Table 50). A subsample of bluegill and redear sunfish were collected from this sampling event to obtain information about the age and growth structure of the populations. Data shows bluegill are reaching 8.0 in as early as 3 years, and overall growth rates are good (Table 51). The majority of the fish collected were 1 and 2 years old ( $51 \%$ and $27 \%$, respectively) and ranged in size up to 6.0 in (Table 52). The bluegill assessment was "Fair" (Table 53). Redear sunfish showed a record high for both fish over 6.0 in and over 8.0 in (Table 54) and a good proportion of the fish collected were over 7.0 and 9.0 in ( $\mathrm{PSD}=45$ and $\mathrm{RSD}=25$; Table 55). Growth rates of the redear sunfish collected were excellent (Table 56) and the majority of the fish collected were 2 and 3 years old ( $56 \%$ and $29 \%$, respectively; Table 57). The overall redear assessment was "Good" (Table 58).

## Miscellaneous

Hydrilla continues to be a problem at Greenbo Lake. The fall largemouth bass sample was not attempted due to excessive weed coverage. In an effort to reduce the amount of vegetation, grass carp were stocked for a third straight year. Fifty-seven grass carp averaging fifteen inches were stocked this year.

## Mill Creek Lake (41 a)

## Black bass sampling (Spring/Fall)

On April 24, Mill Creek Lake was diurnally electrofished for an assessment of the largemouth bass population. In total, 229 fish were sampled ranging in size from 2.0 to 20.0 in (Table 59). Catch rates were right at or above average for all size classes (Table 60). PSD values were among the highest obtained on the lake, but $\mathrm{RSD}_{15}$ values were amongst the lowest (Table 61). In October, fish were collected for determination of age and growth characteristics. Largemouth bass generally exhibit slower growth rates, struggling to reach a harvestable size (15.0 in) before their eighth year (Table 62). Overall, the assessment of largemouth bass in Mill Creek Lake was "Good", boosted by higher catch rates of fish in the 12.0- to 14.9-in range and catch rates of fish over 20.0 in (Table 63).

Also in October, Mill Creek Lake was sampled for determination of relative weights of largemouth bass. In total, 108 fish were collected ranging in size from 2.0 to 15.0 in (Table 64). Relative weights were all at 90 percent (Table 65 ). These values were above the average for the 8.0 - to 11.9 -in and 12.0 - to 14.9 -in categories, but were slightly below average for the greater than 15.0 -in category.

## Sunfish sampling (Summer)

On May 18, Mill Creek Lake was diurnally electrofished for assessment of the bluegill fishery. In total, 189 bluegill were collected ranging in size from 3.0 to 9.0 in (Table 66). Catch rates by size class were all well above the 2005 to 2016 average (Table 67). PSD values showed a decrease over the last couple of samples (2015 and 2012) but remained close to the average since $2005 . \mathrm{RSD}_{8}$ values are spot on the average since 2005 (Table 68). The overall assessment of the bluegill fishery remains as "Good" (Table 69).

## Lake Reba (76a)

Black bass sampling (Spring/Fall)
On April 17, Lake Reba was diurnally electrofished for assessment of the largemouth bass fishery. In total, 831 fish were collected ranging in size from 3.0 to 21.0 in (Table 70). This exceptionally high catch rate was nearly three times the 1995 to 2016 average and was driven almost exclusively by catch rates of fish less than 8.0 in; although all categories were at or above the average (Table 71). Echoing abundance of smaller size classes of fish, PSD and $\mathrm{RSD}_{15}$ values were at (PSD) and below ( $\mathrm{RSD}_{15}$ ) the 1995 to 2016 average (Table 72). The overall assessment of the largemouth bass fishery at Lake Reba was "Excellent" (Table 73).

Lake Reba was once again diurnally electrofished in the fall to collect indices related to spawning class strength, and based on these values, the lake was not stocked in 2017 (Table 74).

## Sunfish sampling (Summer)

On May 3, Lake Reba was diurnally electrofished for assessment of the bluegill and redear sunfish populations. In total, 366 bluegill and 83 redear sunfish were sampled (Table 75). For bluegill, there was a pretty significant drop in overall catch rates over previous years, but more fish over 8.0 in were collected than in any other year (Table 76). Furthermore, PSD and $\mathrm{RDS}_{8}$ values were among the highest collected on the lake (Table 77). Otoliths were also kept from a subsample of 10 fish per inch class and those have demonstrated an improvement in growth rates (Table 78). Otoliths have also shown a more normal distribution of age classes of fish (Table 79). Overall, the bluegill fishery was rated as "Good" which is a dramatic improvement from previous years (Table 80). As was the case with the bluegill, redear sunfish catch rates by size class were also down overall, but more larger fish were collected than in previous years (Table 81). PSD and RDS 9 values were among the highest collected on the lake (Table 82), growth rates have improved (Table 83), and there is a normal distribution of age classes (Table 84). Overall, the assessment of the redear sunfish fishery was "Good" and as with bluegill, was a dramatic improvement from previous years (Table 85).

## Creel Survey

From 01 April to 31 October, a roving creel survey was conducted on Lake Reba. In 2017 there were significantly more trips and man hours spent on the lake than the previous creel survey (2005), which is most likely a reflection of the population growth in Richmond and the surrounding areas (Table 86). The majority of the users on Lake Reba are male residents who spend time still fishing from the bank. The most fished for species on the lake was panfish ( $6,299.8$ trips), followed by black bass ( $2,341.2$ trips), crappie ( 451.7 trips), and catfish ( 422.3 trips; Table 87). The most harvested species were panfish and crappie ( 58,713 and 5,428 , respectively), but the most caught species were panfish and black bass ( 64,565 and 8,8682 , respectively). Anglers had the most success fishing for crappie ( $71.2 \%$ success) and the least for black bass species ( $2.9 \%$ success). Table 88 shows the number of fish harvested and released by inch class. This table shows the very low ( $3 \%$ overall) harvest rate for largemouth bass, but high harvest rates for bluegill, and both species of crappie. Several illegal-sized largemouth bass and channel catfish were also harvested. May and June are the peak months for largemouth bass fishing on the lake, and they are also the months with the highest catch rates (catch per angler hour $=2.04$ and 1.43 , respectively; Table 89). April and October are the peak months for crappie fishing but May and August posted the highest catch rates (catch per angler hour $=3.14$ and 5.47 , respectively; Table 90). Finally, May and June were the peak months for panfish fishing on the lake, but anglers posted healthy catch rates pretty much the whole summer (mean catch per angler hour $=2.94$ fish; Table 91).

## Angler Attitude Survey

In conjunction with the creel survey anglers were asked a series of questions pertaining to their attitudes towards fishing on Lake Reba (Table 92). Anglers were only surveyed once in the year. Of the surveyed anglers, $36 \%$ of
them came from Madison County, another $42 \%$ came from either Estill, Fayette or Clark counties and the remaining $22 \%$ came from a mixture of 24 different Kentucky counties and several surrounding states. Overall, the most fished for species were bluegill, bass, and redear sunfish. Seventy-six percent of anglers fishing for bass were satisfied and those who were not satisfied (17.8\%) were disappointed in the size of the fish caught ( $45.8 \%$ or 22 individuals) or the number of fish caught ( $43.8 \%$ or 21 individuals). Similarly, the majority of the anglers who fished for bluegill, redear sunfish, or catfish were also satisfied ( $71.7 \%, 74.5 \%$ and $80.9 \%$, respectively). The majority of anglers fished 1-4 or 5-8 times a month ( $55.7 \%$ and $28.1 \%$, respectively). Support for the 15.0 -in minimum size limit on largemouth bass was $85.0 \%$. Of those that did not support the regulation (only $13.8 \%$ or 56 anglers), the majority of them wanted to see a 12.0 -in minimum size limit ( 50 individuals). Comically, $3.6 \%$ of the anglers that opposed the 15.0 -in minimum size limit preferred it to be changed to a 15.0 -in minimum size limit.

## Lake Wilgreen (131a)

## Creel Survey

From 01 April to 31 October, a roving creel survey was conducted on Lake Wilgreen and it represents potentially the first creel survey ever conducted on the lake. In total, there were 4,198 trips on the lake ( 30 trips per acre), and anglers spent a total of 16,226 hours on the lake ( 114 hours per acre; Table 93 ). While these overall numbers are much lower than many of our larger lakes, the trips per acre and hours per acre comparisons demonstrate that these smaller lakes receive proportionally much more pressure than our larger lakes. The majority of the users on Lake Wilgreen are male residents who spend time casting from a boat. The most fished for species on the lake was panfish ( $1,632.7$ trips), followed by black bass ( $1,206.8$ trips), catfish ( 713.6 trips), and crappie ( 573.4 trips; Table 94). The most harvested species were panfish and crappie ( 10,780 and 9,754 , respectively) and they were also the most caught species ( 16,187 and 11,977 , respectively). Anglers had the most success fishing for crappie ( $70.0 \%$ success) and the least success fishing for black bass species ( $21.9 \%$ success). Table 95 shows the number of fish harvested and released by inch class. This table shows the very low ( $19 \%$ overall) harvest rate for largemouth bass, but high harvest rates for bluegill, both species of crappie, and blue and channel catfish. There likely is some overlap between the channel and blue catfish with creel clerk and angler difficulties differentiation between these two species; for this reason data should be used with caution. There were consistent numbers of trips made for largemouth bass from April through July but the month with the highest catch rate was May (catch per angler hour = 1.57; Table 96). April was the peak month for crappie fishing but May and June posted the highest catch rates (catch per angler hour $=5.02$ and 5.84 , respectively; Table 97). Finally, June and July were the peak months for panfish fishing on the lake, but anglers posted healthy catch rates from May through August (Table 98).

## Angler Attitude Survey

In conjunction with the creel survey, anglers were asked a series of questions pertaining to their attitudes towards fishing on Lake Wilgreen (Table 99). Anglers were only surveyed once in the year. Of the surveyed anglers, $34 \%$ came from Madison County, another $36 \%$ came from either Fayette, Clark or Estill counties and the remaining 30\% came from a mixture of 26 different Kentucky counties and several surrounding states. Overall, the most fished for species were bass, bluegill and channel catfish. Seventy-one percent of those that fished for bass were satisfied, while those who were not satisfied (22.7\%) were disappointed in the size and the number of fish caught ( $43.9 \%$ or 25 individuals for both). Similarly, the majority of the anglers who fished for bluegill, redear sunfish, or catfish were also satisfied ( $64.6 \%, 47.6 \%$ and $82.8 \%$ respectively). The majority of anglers fish 1-4 or 5-8 times a month ( $55.1 \%$ and $26.3 \%$, respectively). Most anglers support the 12.0 -in minimum size limit on largemouth bass ( $93.1 \%$ ). Of those that did not support it (only $5.5 \%$ or 20 anglers), the majority wanted to see a 15.0 -in minimum size limit ( 15 individuals). Similar to Lake Reba, $5.0 \%$ of the anglers that opposed the 12.0 -in minimum size limit preferred it to be changed to a 12.0 -in minimum size limit.

Table 1: Yearly summary of sampling conditions by waterbody, species sampled and date.

10. Do you support or oppose the current regulation on largemouth bass at Lake Wilgreen? ( $N=362$ )

Support $93.1 \%$ Oppose $5.5 \% \quad$ No Opinion $1.4 \%$
10a. If you oppose, what largemouth bass size limit do you prefer at Lake Wilgreen? ( $N=56$ )
15" MSL (75.0\%); C\&R Only (15.0\%); 12" MSL (5.0\%); No Size Limit (5.0\%)

# SOUTHEASTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Conditions encountered during sampling at southeastern district lakes are listed in Table 1.

## Lake Cumberland (50,250 acres)

Lake levels in Lake Cumberland rose to 705 msl in 2013 and 723 msl in 2014 with the completion of repairs to Wolf Creek Dam. Sampling completed after 2013 was conducted in areas that were sampled prior to 2007. Samples from 2007-2012 were conducted in areas farther downstream in the embayments due to reduced water levels; therefore, any comparisons of the 2007-2012 data should be interpreted accordingly.

## Black Bass Sampling (Spring)

Diurnal electrofishing studies were conducted at Wolf Creek dam, and in the Faubush Creek, Fishing Creek, and Lily Creek embayments of Lake Cumberland during May 2017 to assess the black bass populations. The lengthfrequency and catch-per-unit-effort (CPUE) of the black bass species collected in each area is shown in Table 2, and the catch-per-hour (by area and length group) of the three black bass species are shown in Tables 3-6. Catch rates for largemouth and spotted bass were higher in 2017 than in previous sampling years. Table 7 compares the catch-per-hour by length group of black bass in Lake Cumberland to other SEFD lakes sampled in 2017.

Largemouth bass catch rates met two of the four CPUE management objectives (Table 8), and spotted bass met two of the three management objectives (Table 9). The smallmouth bass population did not meet any of the CPUE management objectives (Tables 10).

Largemouth bass populations exhibited excellent size structure, with a PSD value of 90 and an $\mathrm{RSD}_{15}$ value of 57 (Table 11). Smallmouth bass and spotted bass populations had a good size structure, with a PSD value of 74 and an $\mathrm{RSD}_{14}$ value of 53 for smallmouth bass and a PSD value of 70 and an $\mathrm{RSD}_{14}$ value of 20 for spotted bass (Table 11). Table 12 compares the size structure of black bass populations in Lake Cumberland to other SEFD lakes sampled in 2017.

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted in the Fishing Creek embayment during September to index the largemouth bass year class strength (Tables 13 and 14). Catch rates of age-0 largemouth bass were lower in 2017 than rates observed the last two years (Table 14). Table 15 compares the CPUE of age-0 largemouth bass in Lake Cumberland to other SEFD lakes sampled in fall 2017. Relative weight (Wr) values for largemouth bass and spotted bass collected during September sampling are shown in Table 16. Table 17 compares Wr values for black bass in Lake Cumberland to other SEFD lakes sampled in fall 2017.

## Crappie Sampling

Fall trap netting was conducted in the Fishing Creek and Wolf Creek embayments of Lake Cumberland during October and November 2017 to assess the crappie population. Length frequency and CPUE for black and white crappie from each area are shown in Table 18. The PSD and $\operatorname{RSD}_{10}$ values for white and black crappie are shown in Table 19. Age-growth data from white and black crappie collected in 2017 are shown in Tables 20 and 21, respectively. Age-2 white crappie (73\%) dominated the white crappie catch (Table 22). Age-2 black crappie (2015 year class) comprised $55 \%$ of the black crappie catch (Table 23). The crappie population assessments (white and black) are shown in Table 24. Both black and white crappie rated poor (Table 24). The crappie population met one of the five management objectives (Table 25). Relative weight (Wr) values for black and white crappie are shown in Table 26. Based on crappie caught during striped bass netting and angler reports, our sampling may not be indicative of how good the crappie population actually is.

## Striped Bass Sampling

Gill nets were used in late November and early December 2017 to evaluate the striped bass population in Lake Cumberland. Twenty-five net-nights captured 108 striped bass for a catch rate of 4.3 fish $/ \mathrm{nn}$. Length-frequency and CPUE of striped bass are shown in Table 27. Striped bass ranged from 9.0 to 32.0 in with the mode being the 19.0in class ( 25 fish). All of the management objectives were met for the striped bass population (Table 28). The agegrowth data for striped bass collected during 2017 is shown in Table 29. Eight year-classes were represented in the catch (Table 30). The 2016 (age-1) year class was the most abundant year class collected (51\%), which coincides with the increased (pulsed) stocking rate of approximately 14.6 fish/acre in 2016. Mean length of age- $2+$ fish at capture ( 2015 year class) was 24.3 in , which exceeded the growth objective ( 21.0 in ) for the striped bass fishery (Table 28). The striped bass assessment score was 13 (rating=good; Table 31). Striped bass relative weight (Wr) values are shown in Table 32.

## Cumberland Tailwater

## Trout Sampling (Fall)

Nocturnal electrofishing sampling was conducted November 6 and 7, 2017 to assess the trout population in the Lake Cumberland tailwater. Electrofishing was completed in seven different areas of the tailwater. Table 33 has the length-frequency and CPUE for the three trout species collected in each area. Although catch rates of rainbow trout 15.0-17.9 inches increased dramatically in 2017, the increase is due to stocking 15.0 inch rainbow trout in August and September in addition to the average 9.0 inch trout (Table 34). Brown trout catch rates continue to be low and remain at or below the 21-year average for the tailwater (Table 35). Relative weight $(\mathrm{Wr})$ values for each trout species is shown in Table 36.

## 2017 Daytime Creel Survey

A roving daytime creel survey was conducted on the Cumberland Tailwater from Wolf Creek Dam downstream to Highway 61 Bridge from 1 April-30 November 2017. The tailwater was split into two geographic stratums (upper and lower), and the survey was designed so each stratum could be independently assessed. The upper stratum covered the section from Wolf Creek Dam downstream to Helm's Landing, and the lower section covered the tailwater from Helm's Landing to Highway 61 Bridge. The survey was conducted 18 days per month (10 weekdays and 8 weekend days), and each day consisted of a 6 -hour time period. Boat and bank angler counts were averages based on counts taken twice during the 6 -hour period. Creel data will be presented for the tailwater as a whole, as well as each stratum (upper and lower).

## Cumberland Tailwater Creel Survey (entire tailwater)

Results from the tailwater creel survey are shown in Tables 37-44. Fishing pressure on the tailwater declined for the third consecutive creel. During the 2017 survey, the catch rates for both trout and all species of fish combined increased over previous creel surveys on the tailwater. Trout anglers spent 209,336 hours on the tailwater, which accounted for $91 \%$ of the total hours fished. The number of brown trout caught declined in 2017 and was less than half of the observed catch in 2009. The number of rainbow trout caught increased in 2017 and was consistent with the number of trout caught in 2006 before the Lake Cumberland drawdown, which began in 2007. Trout anglers were generally successful, with catch rates of 1.21 fish $/ \mathrm{hr}$ for bank anglers and $1.59 \mathrm{fish} / \mathrm{hr}$ for boat anglers.

## Upper Cumberland Tailwater Creel Survey (4.5 river miles)

Results from the upper tailwater creel survey are shown in Tables 45-49. Anglers fished a total of 103,828 hours during 29,391 fishing trips, for an average trip length of 3.5 hours in the upper portion. Anglers harvested a total of 12,388 trout per river mile in the upper portion of the tailwater in 2017. Trout anglers in the upper section caught $1.38 \mathrm{fish} / \mathrm{hr}$ and harvested $0.48 \mathrm{fish} / \mathrm{hr}$. Although trout anglers fishing by boat had a slightly higher catch rate, trout anglers who were fishing from the bank had a slightly higher harvest rate than boat anglers.

## Lower Cumberland Tailwater Creel Survey (34.3 river miles)

Results from the lower tailwater creel survey are shown in Tables 50-54. Anglers fished a total of 126,167 hours during 27,981 fishing trips, for an average trip length of 4.5 hours in the lower portion. Anglers harvested a total of 692 trout per river mile in the lower portion of the tailwater in 2017. Trout anglers in the lower section had a slightly higher catch rate ( $1.62 \mathrm{fish} / \mathrm{hr}$ ) than trout anglers in the upper section ( $1.38 \mathrm{fish} / \mathrm{hr}$ ). Trout anglers fishing by
boat in the lower section caught 1.68 fish $/ \mathrm{hr}$, and trout anglers who were fishing from the bank had catch rate of 1.19 fish/hr.

## Cumberland Tailwater Angler Attitude Survey

An angler attitude survey was conducted in conjunction with the creel survey to gather angler opinions about the various fisheries in the Cumberland tailwater (Figure 1). A total of 162 anglers were interviewed in the tailwater. Ninety-six percent of rainbow trout anglers were satisfied with fishing on the tailwater. Brown trout and brook trout anglers had a much lower satisfaction level ( $57 \%$ and $60 \%$, respectively), and the number of fish was listed as the main reason for angler dissatisfaction. In general, anglers were satisfied with the current size and creel limits on the tailwater ( $87 \%$ ). Fifty-nine percent of anglers preferred to fish under low flows ( 1 turbine or less), and $33 \%$ of anglers preferred a moderate flow (1-3 turbine) scenario.

## Laurel River Lake (6,060 acres)

## Black Bass Sampling (Spring)

Electrofishing sampling was conducted during April and May 2017 to assess the black bass population in Laurel River Lake. Electrofishing was conducted in four areas of the lake: 1) dam, 2) Spruce Creek, 3) Laurel River arm, and 4) upper Craigs Creek. Length-frequency and CPUE of the three black bass species collected in each area is shown in Table 55. The catch-per-hour (by area and length group) of the three black bass species are shown in Tables 56-59. Table 7 compares the catch-per-hour by length group of black bass in Laurel River Lake to other SEFD lakes sampled in 2017.

The largemouth bass population met two of the four catch rate objectives (Table 60). Spotted bass met one of the three catch rate management objectives (Table 61). The smallmouth bass population did not meet any of the catch rate management objectives (Table 62).

Smallmouth bass exhibited an excellent size structure, having a PSD value of 90 and an $\mathrm{RSD}_{14}$ value of 50 (Table 63). Largemouth and spotted bass had a good size structure, with largemouth bass having a PSD value of 65 and an $\mathrm{RSD}_{15}$ value of 34 and spotted bass population having a PSD of 57 and an $\mathrm{RSD}_{14}$ of 18 (Table 63). Table 12 compares the size structure values of black bass populations in Laurel River Lake to other SEFD lakes sampled in 2017.

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted in the Laurel River arm on 18 September 2017 to index largemouth bass year class strength (Tables 64 and 65). Although the CPUE of age-0 largemouth bass in 2017 was low, no additional age-0 bass were stocked due to low success of attempted stockings in previous years (Table 65). Relative weight $(\mathrm{Wr})$ values for largemouth and spotted bass collected during September sampling are shown in Table 66.

## Walleye Sampling

Gill nets were used in November 2017 to evaluate the walleye population in Laurel River Lake. A total of 177 walleye were captured in 8 net-nights for a catch rate of 22.1 fish $/ \mathrm{nn}$. Length frequency and CPUE of walleye is shown in Table 67. Walleye ranged from 9.0-24.0 in with the mode being the 11.0-in class ( 32 fish). Two of the three catch rate management objectives for walleye were met in 2017 (Table 68). Age-growth data for male and female walleye are shown in Tables 69 and 70, respectively. The age-growth for both sexes combined is shown in Table 71. Ten year-classes were represented in the catch, with age-0 (2017 year class) and age-2 (2015 year class) walleye comprising $69 \%$ of the catch (Table 72). The walleye assessment score was 14 (rating=excellent; Table 73). Mean length of age-2+ walleye at capture (19.2 in) surpassed the growth objective of 18.0 in (Table 68). Relative weight (Wr) values for walleye are shown in Table 74.

## Cedar Creek Lake (784 acres; Lincoln Co.)

## Black Bass Sampling (Spring)

Diurnal electrofishing was conducted on 30 May 2017 to assess the largemouth bass population in Cedar Creek Lake. The length-frequency and CPUE of largemouth bass is shown in Table 75. Size structure of largemouth bass
was good (PSD=66, $\mathrm{RSD}_{15}=45$; Table 76). The catch-per-hour (by length group) of largemouth bass for 2003-2017 is shown in Table 77. Two of the four CPUE management objectives for the largemouth bass population were met or exceeded (Table 78).

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted on 15 September 2017 to index the largemouth bass year-class strength (Tables 79 and 80 ). Catch rates of age- 0 bass in 2017 were lower than 2016 catch rates but were still high in relation to the 14 year average (Table 80). Relative weight (Wr) values for largemouth bass are found in Table 81.

## Chenoa Lake (35 acres; Bell Co.)

Largemouth Bass Sampling (Spring)
Diurnal electrofishing was conducted on 11 April 2017 at Chenoa Lake to assess the largemouth bass population. Length frequency and CPUE for largemouth bass is shown in Table 82. Catch-per-hour (by length group) for largemouth bass is shown in Table 83. The largemouth bass size structure was fair, with a PSD value of 42 $\left(\mathrm{RSD}_{15}=13\right.$; Table 84).

Largemouth Bass Sampling (Fall)
Diurnal electrofishing was conducted on 5 October 2017 at Chenoa Lake to collect largemouth bass to determine age-growth. Age-growth data from largemouth bass collected in 2017 is shown in Table 85. Relative weight values for largemouth bass are in Table 86.

## Lake Linville (358 acres; Rockcastle Co.)

## Black Bass Sampling (Spring)

Diurnal electrofishing was conducted on 31 May 2017 at Lake Linville to assess the black bass population. Length frequency and CPUE for the black bass populations are shown in Tables 87-89. Although overall catch rates for largemouth bass have declined over the years, there has been an increase in catch rates of larger-sized bass (Table 88). A population assessment for largemouth bass is shown in Table 90. All of the catch rate management objectives were met (Table 90). The size structure for the largemouth bass population was fair with a PSD value of $48\left(\mathrm{RSD}_{15}=16\right)$, and the spotted bass population is comprised of small individuals ( $\mathrm{PSD}=26, \mathrm{RSD}_{14}=2$; Table 91$)$.

## Largemouth Bass Sampling (Fall)

Diurnal electrofishing was conducted on 4 October 2017 at Linville Lake to collect largemouth bass to determine age-growth. Age-growth data from largemouth bass collected in 2017 is shown in Table 92. Relative weight values for largemouth bass are in Table 93.

## Wood Creek Lake (625 acres; Laurel Co.)

## Black Bass Sampling (Spring)

Diurnal electrofishing was conducted on 4 May 2017 in the Pump Station and Dock areas of Wood Creek Lake to assess the black bass population. Length frequency and CPUE for black bass are shown in Table 94. The size structure for largemouth bass was poor, having a PSD value of $25\left(\mathrm{RSD}_{15}=4\right.$; Table 95$)$. The spotted bass population also had a poor size structure ( $\mathrm{PSD}=34, \mathrm{RSD}_{14}=3$; Table 95 ). Catch-per-hour (by length group) for largemouth and spotted bass are shown in Tables 96 and 97, respectively. The largemouth bass catch rates have been increasing the last few years, due in large part to increasing numbers of bass less than 12.0 in . A largemouth bass population assessment is shown in Table 98. Two of the four catch rate management objectives were met for the largemouth bass population (Table 98).

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted on 26 September 2017 in the Pump Station and Dock areas of Wood Creek Lake to index largemouth bass year class strength (Tables 99 and 100). Catch rates of age-0 largemouth bass in

2017 were lower than average (Table 100); thus, additional age-0 bass were stocked in the lake during the fall. Relative weight values for largemouth and spotted bass are shown in Table 101.

Table 1. Summary of sampling conditions by waterbody, species sampled, and date for the Southeastern Fisheries District in 2017.

| Water body Location | Species | Date | $\begin{gathered} \text { Time } \\ (24 \mathrm{hr}) \\ \hline \end{gathered}$ | Gear | Weather | Water temp. F | Water level | Secchi <br> (in) | Conditions | Pertinent sampling comments |

## EASTERN FISHERY DISTRICT

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Table 1 shows sampling conditions by water body for eastern fishery district lakes in 2017.

## Buckhorn Lake

During January, muskellunge were sampled via boat electrofishing (Tables 2-3). Water clarity was murky with a secchi reading of 10.0 in (Table 1). This may have hindered observation and sampling of some fish. Some larger fish $\geq 36.0$ in were observed and not caught. Fish were sampled from 11.0-38.0 in (Table 2). The largest fish collected was 38.8 in and 16.87 lbs and was a female. An assessment rating of "Poor" was observed for the fishery (Table 3). Muskellunge (420, 11.8 in ) were stocked in September. Stocking sites included the marina and Trace Fork boat ramps. These fish were marked with a caudal fin microwire tag.

Spring and fall electrofishing was used to sample black bass (Tables 4-9). Spring sampling was shortened due to a rain event and fall sampling was shortened due to conflicts with a bass tournament. Largemouth bass were sampled from 3.0-20.0 inches in the spring sample (Table 4). Recent spring assessment ratings for largemouth bass have been "Good" (Table 7). Fall sampling observed age-0 largemouth bass numbers to be above average (Table 9) and no supplemental stocking of fingerlings occurred. A high number of age-0 fish each year is necessary for overwintering recruitment at this lake.

White crappie were sampled with trap nets in the fall. Fish were sampled from 2.5-12.0 in (Table 10). PSD, RSD, age and growth, and age frequency are listed in Tables 11-13. Mean age-2 length at capture was 7.5 in and the population assessment observed a rating of "Good" (Table 14). This mean length of 7.5 in is an improvement over the last data acquired in 2015. This is still slightly lower than the $8.0-8.3$ in value observed prior to the $9.0-\mathrm{in}$ minimum length regulation implemented in 2007. Future management may require this regulation to be removed to improve growth rates and reduce small fish numbers. However, increased natural mortality, poor recruitment years, and spillway loss could also lead to natural reduction in numbers.

Additional fish stocking occurred throughout the year at the tailwater area below the dam. Approximately 5,000 rainbow trout (8.0-12.0 in) were stocked during the months of April-June and October-November.

Habitat projects were completed in summer and fall. A total of 6 shallow water brushpiles were refurbished and 1 new Christmas tree reef, 10 new pallet structures, and 1 plastic tree site were constructed. In addition, 425 lbs of winter wheat was sowed onto exposed mud flats.

## Carr Creek Lake

Electrofishing was used to sample black bass in the spring and fall (Tables 15-20). Some of the total CPUE's for largemouth bass have been high in recent years due to spring vs fall stocking of fingerlings (Table 16). The largemouth bass assessment rating was "Good" (Table 18). Angler success has been good with tournament numbers increasing on weekends as well as during nighttime during the weekdays. Below average age-0 largemouth bass numbers were observed in the fall (Table 20). During March 2018, a total of 7,000 largemouth bass fingerlings will be stocked to supplement the 2017 age- 0 class.

Tables 21-22 contain information from spring electrofishing for walleye. Total CPUE was similar to recent years (Table 21). Larger size fish have been infrequent in recent sampling efforts (Table 21). This may be a result of previous broodfish collection at the lake and/or poor sampling conditions for larger fish. An estimated 35,022 walleye ( 1.5 in ) were stocked in May.

Early spring electrofishing was used to collect black and white crappie (Tables 23-28). Black and black-nosed black crappie, and white crappie were sampled. The fishery has a special regulation of a 9.0 -in minimum size limit. During the fall of 2009, a research study was initiated on white crappie recruitment. Totals of $5,440,9,676,3,822$, 17,814 , and 18,160 white crappie were stocked from 2009-2013, respectively. The total CPUE has fluctuated greatly from year to year (Table 24), but crappie populations can be cyclic in numbers. Tables 26-27 contain age and growth data for black and white crappie. Small fish were not collected, whereby no age-2 or younger fish are included in the age and growth data. Most fish collected were ages 3-8 for both black and white crappie (Table 28).

Tailwater stockings included 1000 rainbow trout/month during the months of 4, 5, 6, 10, and 11.
Fish habitat work consisted of refurbishing 2 shallow water brushpiles and preparation with the habitat branch crew for a large-scale project in future. Preparation included several meetings and collection of materials for early 2018 deployment. Several spot treatments of herbicide were applied to dense areas of hydrilla and 200 grass carp were stocked in October to assist with hydrilla removal.

A day (1 March-31 October) and night (1 May-31 August) creel survey was conducted at Carr Creek Lake during 2017. Both day and night surveys were random roving creel designs (date and time) and the lake was treated as one area. Day surveys consisted of 2,6 -hour periods (morning starting at 600 hrs and afternoon starting at 1300 hrs ) and night surveys of 1, 6 -hour period starting at dusk. Angler counts would be conducted in the middle of each respective 6-hour time period. Data from the day and night creel survey is presented in Tables 29-38.

The 2017 day creel survey ( 1 March-31 October) produced more fishing trips and angler hours than the last survey in 2009 (1 April-31 October) on the lake. During 2017, the total number of day fishing trips was 7,706 at the lake (Table 29). A total of 2,387 day fishing trips occurred during the 2009 creel survey. During 2017, the total number of night fishing trips was 2,576 at the lake (Table 29). A total of 2,614 night fishing trips occurred during the 2009 creel survey. The significant number of angler trips and hours occurring at night even though the calendar time was of shorter duration was expected due to the popularity of night tournaments. Total angler hours were 25,667 during the day and 10,438 at night in 2017 and 17,643 and 13,462 for day and night surveys, respectively in 2009. Angler success rates at the lake during the day in 2017 were $25.97 \%$ for panfish, $17.24 \%$ for catfish, $15.94 \%$ for crappie, $10.00 \%$ for walleye, and $0.67 \%$ for black bass (Table 30). Angler success rates at the lake during the day in 2009 were $40.68 \%$ for panfish, $29.41 \%$ for catfish, $28.41 \%$ for crappie, $26.87 \%$ for walleye, and $3.93 \%$ for black bass. Angler success rates at the lake during the night in 2017 were $0.00 \%$ for panfish, $12.64 \%$ for catfish, $12.64 \%$ for crappie, $16.67 \%$ for walleye, and $0.61 \%$ for black bass (Table 31). Angler success rates at the lake during the night in 2009 were $18.18 \%$ for panfish, $15.38 \%$ for catfish, $33.33 \%$ for crappie, 32.00 for walleye, and $3.85 \%$ for black bass. During the 2017-day survey, bluegill were the most numerous caught fish (Table 30) while largemouth bass were most numerous in the night survey (Table 31). Largemouth bass were the most numerous fish caught during both the day and night surveys of 2009 .

An angler attitude survey was conducted in conjunction with the angler creel survey at the lake to obtain further information. Anglers were asked to answer a series of questions regarding the fishery at Carr Creek Lake (Appendix A). Anglers were surveyed throughout the creel during 2017 with anglers only being asked the questions once. A total of 43 surveys were completed during the lake creel. Black bass at $74.4 \%(\mathrm{~N}=32)$ were the most popular species fished for on the lake followed by bluegill/redear at $53.3 \%(\mathrm{~N}=23)$, crappie at $48.8 \%(\mathrm{~N}=21)$, catfish at $37.2 \%(\mathrm{~N}=16)$, and walleye at $30.2 \%(\mathrm{~N}=13)$. Level of fishing satisfaction was asked for several fish groups or species and only one category was observed to exceed $50.0 \%$ of anglers being somewhat to very satisfied. This was catfish at $64.3 \%$. Angler responses found $42.9 \%$ to fish tournaments with $0.0 \%$ using the KDFWR tournament website registration page. Approximately $76.2 \%$ of anglers were aware of KDFWR placing fish habitat in the lake and $72.7 \%$ of anglers said this improved their fishing.

## Cranks Creek Lake

Black bass were sampled in the spring and fall with boat electrofishing (Tables 39-44). Largemouth bass comprise the major fishery and in recent years are producing a good number of trophy size fish. During spring, largemouth bass were sampled from 3.0-23.5 in (Table 39). The CPUE of largemouth bass $\geq 20.0$ in ( $8.8 \mathrm{fish} / \mathrm{hr}$ ) is higher than historical lake values. With high catch-and-release rates and continuance of the trout stocking program, this lake
will continue to provide good opportunity for large fish. Fall age-0 CPUE was above average (Table 44) and no supplemental stocking of largemouth bass fingerlings occurred in the fall.
Brittle naiad has become a nuisance in shallow upper lake areas and requires some herbicide application at boat access areas. However, this thick growth of aquatic vegetation has correlated with a trend of increased quality fisheries for largemouth bass, white crappie, and redear sunfish.

Rainbow trout were stocked at 1,250/mo during January, April, May, and October for a total of 5,000 fish. No fish habitat work was performed in 2017. Repair work was finished on the boat ramp access near the marina and a new courtesy dock was installed. Some herbicide was applied at this ramp access for brittle naiad control.

## Dewey Lake

Black bass sampling was completed during the spring and fall of 2017 (Tables 45-50). Since the loss of the dense hydrilla infestation at the lake, the smaller largemouth bass size group CPUE's are running at average or below average and CPUE's of length groups 15.0 in and greater are average or above average (Table 46). Also, angler success with numbers of keeper-size fish continues to improve. The largemouth bass assessment rating has rated "Good" from 2013-2017 (Table 48). The total CPUE of age-0 fish was above average (Table 50) and no supplemental age-0 fingerling bass were stocked in 2017.

Fish stockings consisted of blue catfish and musky in the lake and rainbow trout in the tailwater. A total of 11,000 blue catfish (5.0-9.0 in) were stocked in April and an additional 11,000 (6.0-8.0 in) were stocked in October. Muskellunge ( 12.7 in ; 376 fish) were stocked in late July. Rainbow trout were stocked in the tailwater of Dewey Lake in April, May, October, and November (1,000/mo; 8.0-12.0 in).

A good amount of new and refurbished fish habitat structures were completed. This work consisted of 9 new shallow water brushpiles, 6 refurbished shallow water brushpiles, 5 new deep water brushpiles, 1 refurbished deep water brushpile, 1 new stake bed, 2 refurbished stake beds, 1 hinge-cut tree, and 200 lbs of wheat seed sowed. Maintenance was performed at Stratton Branch boat ramp with sediment removal and with mowing of bank access in this area. Additional maintenance occurred at the Jenny Wiley State Park campground boat access with signage and courtesy dock maintenance.

## Fishtrap Lake

Black bass were sampled in the spring and fall with boat electrofishing. Spring data can be found in Tables 51-54. This lake experienced an extreme drawdown of approximately 42 ft during the winter of 2016-2017 for hydraulic gate repairs in the dam. During 2017, this appeared to create a "new lake effect" with spawning and recruitment. However, there was loss of larger fish through the spillway during the winter drawdown. The largemouth bass spring assessment decreased to a rating of "Fair" (Table 54). This could be attributed to lower scores in older-age length groups. This fishery is expected to return to a "Good" assessment value quickly. Fall length frequencies and CPUE for smallmouth, spotted, and largemouth bass are presented in Table 55. Age-0 largemouth bass numbers were average (Table 56), however a decision was made to add a light supplemental stocking of approximately 4,000 fingerlings in March 2018. Age and growth data was collected for largemouth bass from the fall sampling (Table 57). Mean length of age- 3 fish was 11.8 in and approximately equal to the last value of 11.7 in obtained in 2010.

Trap nets were utilized in the fall to sample white crappie for population evaluation (Tables 58-62). A total of 20 net-nights were used and with a lot of moving of net locations to improve catches to no avail (Table 58). There was difficulty with sampling of small fish and this was also observed during 2015 trap net sampling. However, primarily catching larger crappie in the trap nets fit with angler rod and reel reports. Additionally, the high PSD and RSD values from the trap netting agree with this trend (Table 59). Age and growth data is provided in Table 60. The mean length of age-2 fish at capture was 9.6 in (Table 62). This is the highest value ever obtained from trap netting. The assessment value obtained was "Good" and similar to the last sample in 2015 with age- 0 and age- 1 scores lowering the value some (Table 62).

Several fish stockings occurred during the year at Fishtrap Lake. A total of 11,460 blue catfish (6.0-9.0 in) were stocked in the lake during April and an additional 11,000 (6.0-8.0 in) blue catfish were stocked in October. During May, native strain walleye ( 9,$000 ; 2.3 \mathrm{in}$ ) were stocked in the Levisa Fork River upstream of Fishtrap Lake. Hybrid striped bass $(25,400 ; 1.5 \mathrm{in})$ were stocked in June. Rainbow trout $(10,000)$ were stocked in the tailwater $(2,000 / \mathrm{mo}$ for months $4,5,6,10$, and 11). Fish habitat work consisted of 3 new Christmas tree and hardwood brushpiles in deep water. Approximately 18 Christmas trees were collected at the lake drop-off site.

## Fishpond Lake

Largemouth bass were sampled via nocturnal electrofishing at Fishpond Lake (32 acres) on 12 April 2017 (Tables 63-65). Fish were collected from 6.0-23.0 in (Table 63) and length group CPUE's were fairly consistent with previous years (Table 64). This lake continues its trophy bass status with the high PSD and $\mathrm{RSD}_{15}$ values (Table 65). With these high PSD and RSD values, it is important to continue to observe recruitment of young fish or supplemental stocking may have to occur some years.

Additional management at Fishpond Lake entails fertilization and some fish stockings. Spring lake fertilization is conducted in order to increase zooplankton density for young-of-year fishes and to limit the filamentous algae growth. This lake is typically very clear and shoreline areas clog with filamentous algae without the addition of fertilizer in the spring. A total of 5,000 rainbow trout ( 8.0 in ) are stocked annually during January, April, May, and October. Channel catfish ( 9.0 in ) are stocked every other year.

## Martins Fork Lake

Flooding prevented spring sampling during 2016 and 2017. Fall electrofishing was conducted for black bass and walleye population assessment (Tables 66-67). Largemouth bass were collected from 3.0-21.0 in (Table 66) and age-0 numbers were above average (Table 67), whereby no supplemental stocking of fingerling bass was done. Similar to sampling in 2016, there were no walleye collected in this sample. However, anglers are catching some of the native strain walleye in the lake now. The native strain walleye have been stocked annually since 2013. During 2019, in addition to CPUE and length frequency data collection for black bass and walleye, there will be additional early spring electrofishing for walleye broodfish acquisition.

Native strain walleye and rainbow trout were stocked in 2017. A total of 10,027 native strain walleye ( 2.3 in ) were stocked in June. Rainbow trout were stocked at the tailwater throughout the year for an approximate total of 3,750 fish ( 750 fish/month for months $4,5,6,10$, and 11).

One new Christmas tree brushpile was constructed in the lake in 2017. Christmas tree brushpile construction and stake bed habitat is planned for the lake in 2018.

## Paintsville Lake

Tables 68-73 contain spring and fall black bass electrofishing data. Although implemented in 2002, the 12.0- to 14.9-in slot length limit has not showed a trend towards increasing fish numbers in the protected slot as expected (Table 69). It has been recommended to remove the largemouth bass slot length regulation for 2019 and revert back to the statewide 12 -in minimum size limit. The largemouth bass assessment rated "Fair" (Table 71). The CPUE assessment parameter for fish 12.0-14.9 in continually scores low affecting lower scoring (Table 71). Age-0 largemouth bass CPUE's continue above average (Table 73) and has coincided with the establishment of several non-native aquatic plants at the lake.

The lake received a stocking of 4,500 rainbow trout (8.0-12.0 in) during February. Some holdover trout are observed each year during bass and walleye sampling. The tailwater trout fishery received 20,000 rainbow trout from April to November and 300 brown trout in April.

Fish habitat work consisted of plastic structures and brushpile construction. Ten plastic tree structures were deployed at one site, one new Christmas tree brushpile and three new hardwood/Christmas tree brushpiles were constructed. No herbicide applications were done at boat access points during the year.

## Pikeville City Lake

This lake was sampled in the spring with boat electrofishing to evaluate the largemouth bass population (Tables 7476). Fish were sampled from 3.0-21.0 in (Table 74). The fishery remains popular with anglers and has numerous large fish as shown by the PSD and $\mathrm{RSD}_{15}$ values (Table 76). The PSD and $\mathrm{RSD}_{15}$ values are high, but expected with the current catch-and-release-only management regulation. No fish were observed with disease or health issues during this sampling effort and there is still some annual recruitment of young fish.

The primary fisheries at Pikeville City Lake (20 acres) are largemouth bass, bluegill, white crappie, common carp, and channel catfish. This lake has a catch-and-release only regulation for largemouth bass and contains gizzard shad. During 2017, some new stocking programs were initiated (rainbow trout and channel catfish). Rainbow trout stockings will total 2,500 fish a year with 1,250 in March and 1,250 in November. A total of 600 channel catfish will be stocked every other year (even years) in summer.

## Yatesville Lake

Electrofishing was utilized to sample black bass during the spring and fall (Tables 77-82). The largemouth bass spring assessment of "Good" with a value of 16 had not been this high since 2007 (Table 80). This is good for the fishery with the numerous fishing tournaments and pressure that occurs there. PSD and RSD 15 values remain good for the largemouth bass fishery (Table 79). The fishery continues to be dominated by largemouth bass with spotted bass accounting for $10 \%$ or less of the population. Age-0 largemouth bass CPUE's were above average in the fall sampling (Table 82) and no supplemental stocking of fingerlings occurred in the fall.

Rainbow trout were stocked in the tailwater of Yatesville Lake at 750 fish/month for months 4, 5, and $11(2,250$ fish total). Fish habitat was added with 1 plastic tree structure site and 3 new hardwood brushpiles.

Appendix A. Carr Creek Lake Angler Attitude Survey 2017
Frequency Table ( $\mathrm{N}=43$ )

| Q3. On average how many times do you fish Carr Creek Lake in a year? |  |  |
| :--- | :---: | ---: |
|  | Frequency | Percent |
| First Time | 1 | $2.4 \%$ |
| 1 to 4 | 11 | $26.8 \%$ |
| 5 to 10 | 9 | $22.0 \%$ |
| More than 10 | 20 | $48.8 \%$ |
| Total | 41 |  |
| No Response | 2 |  |

| Q4. Which species of fish do you fish for at Carr Creek Lake? (Bass) |  |  |
| :--- | :---: | ---: |
|  | Frequency | Percent |
| Bass | 32 | $74.4 \%$ |
| Crappie | 21 | $48.8 \%$ |
| Bluegill/Redear | 23 | $53.5 \%$ |
| Catfish | 16 | $37.2 \%$ |
| Walleye | 13 | $30.2 \%$ |
| Carp | 1 | $2.3 \%$ |

Q5. Which one species do you fish for most at Carr Creek Lake (check only one)?

|  | Frequency | Percent |
| :--- | :---: | ---: |
| Bass | 22 | $61.1 \%$ |
| Crappie | 3 | $8.3 \%$ |
| Bluegill/Redear | 4 | $11.1 \%$ |
| Catfish | 6 | $16.7 \%$ |
| Walleye | 1 | $2.8 \%$ |
| Total | 36 |  |
| No Response | 7 |  |

Q6. In general, what level of satisfaction or dissatisfaction do you have with bass fishing at Carr Creek Lake?

|  | Frequency | Percent |
| :--- | :---: | ---: |
| Very Satisfied | 1 | $3.1 \%$ |
| Somewhat Satisfied | 11 | $34.4 \%$ |
| Neutral | 7 | $21.9 \%$ |
| Somewhat Dissatisfied | 10 | $31.3 \%$ |
| Very Dissatisfied | 3 | $9.4 \%$ |
| No Opinion | 0 | $0.0 \%$ |
| Total | 32 |  |
| No Response | 11 |  |

Appendix A (cont).
Q6a. If you responded with very or somewhat satisfied in question (6) What is the single most important reason for your satisfaction?

|  | Frequency | Percent |
| :--- | :---: | ---: |
| Number of fish | 5 | $38.5 \%$ |
| Size of fish | 7 | $53.8 \%$ |
| Size limit | 0 | $0.0 \%$ |
| Creel limit | 1 | $7.7 \%$ |
| Low angler pressure | 0 | $0.0 \%$ |
| Total | 13 |  |
| No Response | 30 |  |

Q6b. If you responded with somewhat or very dissatisfied in question (6) what is the single most important reason for your dissatisfaction?

|  | Frequency | Percent |
| :--- | :---: | ---: |
| Number of fish | 10 | $76.9 \%$ |
| Size of fish | 1 | $7.7 \%$ |
| Size limit | 0 | $0.0 \%$ |
| Creel limit | 0 | $0.0 \%$ |
| Too many anglers | 0 | $0.0 \%$ |
| limited habitat/good areas to fish | 1 | $7.7 \%$ |
| slot limit on bass like Paints ville or raise the size limit | 1 | $7.7 \%$ |
| Total | 13 |  |
| No Response | 30 |  |

Q7. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Carr Creek Lake?

|  | Frequency | Percent |
| :--- | :---: | ---: |
| Very Satisfied | 3 | $13.6 \%$ |
| Somewhat Satisfied | 4 | $18.2 \%$ |
| Neutral | 3 | $13.6 \%$ |
| Somewhat Dissatisfied | 9 | $40.9 \%$ |
| Very Dissatisfied | 3 | $13.6 \%$ |

# WESTERN FISHERIES DISTRICT <br> Project B: Stream Fishery Surveys - Warmwater Streams <br> FINDINGS 

## Lower Tennessee River

Diurnal electrofishing (120 PPS DC current) was conducted on September 07 and 112017 in the lower Tennessee River (TRM 22.4) below Kentucky Lake Dam downstream to river mile 17. A total of 3.25 hours of sampling yielded 5039 fish, comprised of 39 species (Table 1). The sample at river mile 22.4 was conducted by the Critical Species Investigation (CSI) branch and included the collection of shad and herrings. Of the sportfish collected in the most recent study, bluegill had the highest catch rate at 28.6 fish $/ \mathrm{hr}$. The catch rate ( $26.2 \mathrm{fish} / \mathrm{hr}$ ) for largemouth bass was down from the 40.3 fish $/ \mathrm{hr}$ collected in 2015 . The catch rate for all catfish was $13.5 \mathrm{fish} / \mathrm{hr}$ in the most recent study, as compared to approximately 54.3 fish/hr collected in 2015. Low pulse (15 PPS) DC current was used to help collect catfish in some of the sampling locations. The catch rates of catfish in all of these surveys should always be used with caution because the amount of time dedicated to low pulse (15pps DC current) shocking was at the discretion of the driver and was typically based on an anticipation of higher catch rates due to habitat differences such as greater depth and the presence of woody debris. The catch rate of silver carp was $36.9 \mathrm{fish} / \mathrm{hr}$.

## Lower Cumberland River

The lower Cumberland River was sampled using diurnal electrofishing on 11 and 20 September 2017 below Lake Barkley Dam (CRM 30.6 sampled by CSI branch) and near Dycusburg, KY (CRM 20.0). A total of 2.0 hours of electrofishing yielded 4118 fish, comprised of 33 species (Table 2). As seen in previous years, largemouth bass and bluegill accounted for the highest catch rates of all sportfish species ( 29.6 fish $/ \mathrm{hr}$ and $18.0 \mathrm{fish} / \mathrm{hr}$, respectively). The catch rate of silver carp was 10.0 fish $/ \mathrm{hr}$, as compared to 18.0 fish $/ \mathrm{hr}$ collected during the 2015 study. The highest catch rates (excluding shad) were those of longnose gar ( $45.2 \mathrm{fish} / \mathrm{hr}$ ).

## Ohio River

The Ohio River was sampled using diurnal electrofishing on 26 August and 6 September 2017. Sampling areas included Smithland Tailwater (ORM 918.5-920.1) and the area between Dam \#52 and Shawnee Steam Plant (ORM 938.9-946.4). A total of 497 ( 141.7 fish/hr) fish, comprised of 27 species were collected (Table 3). The catch rate for largemouth bass ( $4.0 \mathrm{fish} / \mathrm{hr}$ ) was lower than 2015 ( $5.0 \mathrm{fish} / \mathrm{hr}$ ), but was higher than 2013 ( $2.0 \mathrm{fish} / \mathrm{hr}$ ). Channel catfish had the highest catch rate ( 22.9 fish $/ \mathrm{hr}$ ). Low pulse ( 15 PPS) DC current was used to help collect catfish in some of the sampling locations. A total of 3.5 hours (14-900-second runs) were directed at all fish except for shad and herrings. Silver carp catch rates were 12.0 fish $/ \mathrm{hr}$, with most fish collected when corralled near a wing dyke.

## Mississippi River

The Mississippi River was sampled at two locations on September 8 and 252017 by diurnal electrofishing. The first site was near Wickliffe, KY. The second site was near Columbus Belmont, KY. The 3.5 hours of sampling effort yielded 520 ( $173.3 \mathrm{fish} / \mathrm{hr}$ ) sportfish comprised of 18 different species (Table 4 ). White bass were
collected at a rate of 3.0 fish $/ \mathrm{hr}$, down from 8.3 fish $/ \mathrm{hr}$ collected in 2015. Catfish species made up the majority of fish collected. The catch rate for all catfish was 91.7 fish $/ \mathrm{hr}$, which was up from the 56.0 fish $/ \mathrm{hr}$ collected in 2015. Low pulse (15 PPS) DC current was selectively used to collect catfish species in both studies. Silver carp catch rates were lower in the Mississippi river ( 4.0 fish $/ \mathrm{hr}$ ) than in other rivers we sampled this year, but this may have more to do with sampling conditions rather than actual relative abundance.

Table 1. Relative species abundance and size distribution of species collected during diurnal electrofishing (PPS 120) on the Lower Tennessee River on 11 and 07 September 2017. Sample sites were in the area of river mile 22 and 17. Total effort was 3.25 hours. Low pulse (15 PPS) was used for short periods of time in some areas

## wdtr.d17

* only collected at Kentucky Dam tailwaters (RVM 22)

Table 2. Relative species abundance and size distribution of species collected during diurnal electrofishing (120 PPS) on the Lower Cumberland River on 11 and 20 September 2017. Sample sites were in the area of river mile 30 and 20. Total effort was 2.0 hours. The sampling runs at mile 20 were directed at all fish species excluding shad, small cyprinids, and atherinids. The sampling runs at mile 30 (Barkley Dam tailwaters) were directed at all fish species. Low pulse (15 PPS) was used for approximately 0.25 hours of the total sample time.

wfdcr.d17

* only collected in barkley dam tailwaters (RVM 30 ).

Table 3. Relative species abundance and size distribution of species collected during diurnal electrofishing (120 PPS) on the Ohio River on 26 August and 6 September 2017. Sample sites were in the area of river mile 944 and 920. Total effort was 3.5 hours consisting of fourteen, 900 -second runs directed at all fish species excluding shad and small cyprinids. Low pulse ( 15 PPS ) was used for approximately 0.75 hours of the total sample time.

Table 4. Relative species abundance and size distribution of species collected during diurnal electrofishing (120 PPS) on the Mississippi River on 8 and 25 September 2017. Sample sites were in the area of river mile 950 (just downstream of Wickliffe, KY) and 936 (just downstream of Columbus Belmont, KY).
Total effort, 3.0 hours, of electrofishing was exerted; 12-900-second runs at each site where all species (excluding shad and small cyprinids) were dipped.
Low pulse (15 PPS) was used for a short periods during the total sample time.

## WESTERN FISHERY DISTRICT

## Project B: Technical Guidance

## FINDINGS

Table 1. Technical guidance given to pond owners in the Western Fishery District during the 2017 project year (April 1, 2017 - March 31, 2018). Approximately 84 telephone calls to the office regarding technical guidance and stocking were also handled. Additionally, numerous emails were replied to requesting farm pond technical guidance information.

| $\begin{gathered} \text { County } \\ \text { Pond Owner } \end{gathered}$ | Date of Inspection | Findings | Management Recommendations |
| :---: | :---: | :---: | :---: |
| Calloway |  |  |  |
| Anthony Sheppard | 16-May | filamentous algae, low alkalinity, crappie, stunted bass | lime, fertilize, remove crappie, harvest bass |
| Greg McNutt | 13-Apr | stunted catfish, stunted bluegill | removal of some catfish, stock bass |
| Bill Elkins | 7-Jun | low alkalinity, no bluegill observed | lime, fertilize, stock minnows and bluegill in fall. |
| Kevin Cherry | 23-Jun | stunted fish, low alkalinity | lime, fertilize, control willows on levee, aerate. Harvest bass >12 inches for trophy bluegill |
| Jeff Jones | 24-Jul | small bass | harvest small bass and large male bluegill |
| Jerry Penner | 22-Sep | low DO, skinny catfish | use fountain more frequently, feed catfish pellet feed |
| Jerry Penner | 22-Sep | muddy water | lime, and potentially gypsum if lime does not clear water. |

## Graves

| Robert or Becca Foy | 30-May | primrose, small bass | lime, 2-4-D, fertilize, stock minnows, <br> aerate <br> glyphosate, trap muskrats, clean |
| :---: | :---: | :---: | :---: |
| Chris | 30-May muskrats, primrose, weeds, crappie | levees, fix leak with clay, remove <br> crappie |  |
| Randy Adams | 15-Jun | lack of large catfish | lime, aerate, fertlize, clean levee, <br> stock minnows, bass. Remove <br> crappie |
| Jon Lilequist | 15-Jun | stunted bass | lime, aerate, harvest small bass, <br> harvest large bluegill |
| Monte Davidson | 18-Jun | Algae and stunted fish | lime, aerate,fertlize, clean levee, |
| stock minnows |  |  |  |

| County <br> Pond Owner | Date of Inspection | Findings | Management Recommendations |
| :---: | :---: | :---: | :---: |
| Livingston |  |  |  |
| Ronnie James | 31-Mar | crappie, low alkalinity, filamentous algae | harvest all crappie, add lime, treat with copper sulfate after liming |
| Hickman |  |  |  |
| Rick Stutts | 26-May | duckweed, coontail | treat with diquat, stock grass carp |
| McCracken |  |  |  |
| Russ Litsinger |  |  |  |
|  | 14-Jun | muddy water, weeds, low alkalinity | lime, fertilize, stock bass |
| Eva Kelley |  |  |  |
|  | $22-\mathrm{Apr}$ | low alkalinity, fish kill, low DO | Aerator, lime, fertilize |

## NORTHWESTERN FISHERY DISTRICT

## Project B: Technical Guidance

## FINDINGS

Requests for technical guidance information were received via e-mails, phone calls, and office visits. Problems included unbalanced populations, new pond construction, stocking, fish disease and fish kills, water quality issues, aquatic vegetation control, and general pond management. No on-site visits were conducted. The requested information was relayed via phone, e-mail, office visit, and referencing the Pond Management section of the web site.

## SOUTHWESTERN FISHERY DISTRICT

Project B: Technical Guidance

## FINDINGS

Onsite technical guidance given during 2017: Numerous emails and phone calls taken, but were not enumerated.
Table 1: Onsite technical guidance visits during 2017

| County | Date | Landowner | Problem/Situation | Recommendations |
| :--- | :---: | :--- | :--- | :--- |
| Barren | $9 / 20$ | Nate Crimmins | Old pond/siltation/No fish <br> Crowded bass \& crappie | Contact NRCS \& clean out/resize <br> accordingly |
| Taylor | $11 / 21$ | Taylor Co. <br> Sportsman's Club | Bluegill thin/Gizzard shad | Restock catfish if desired, shad <br> reduction/kill options |
| Logan | $12 / 1$ | David Fields | Increase size\& depth | Contact NRCS \& resize accordingly |
| Warren | $9 / 20$ | Barry Lemily | No fish/Pond depth/siltation | Clean out, lime \& restock |

## CENTRAL FISHERIES DISTRICT <br> Project B: Stream Fishery Surveys - Warmwater Streams <br> FINDINGS

Stream sampling conditions for 2017 are summarized in Table 1.
Diurnal electrofishing for black bass and rock bass was conducted during April 2017 at three locations on Floyds Fork. Length distribution and CPUE data of black bass and rock bass from Floyds Fork are presented in Table 2. Smallmouth bass ( $69 \%$ ) comprised the majority of the black bass sampled in Floyds Fork, whereas, largemouth bass and spotted bass comprised $16 \%$ and $15 \%$ of the sample, respectively. The catch rate of smallmouth bass on Floyds Fork in 2017 ( 21.4 fish $/ \mathrm{hr}$ ) was higher than the historical average ( $15.4 \mathrm{fish} / \mathrm{hr}$ ) (Table 3). However, the catch rate of rock bass ( $7.4 \mathrm{fish} / \mathrm{hr}$ ) was lower than the historical average ( $10.8 \mathrm{fish} / \mathrm{hr}$ ) (Table 4). The smallmouth bass population assessment rating for Floyds Fork was "Good", the average rating observed since 2012 (Table 5). The largemouth bass and rock bass population assessment ratings were "Fair", which is the average rating for both species in the Floyds Fork (Tables 6 and 7).

Rainbow trout were stocked during March, April and October 2017 in the North Beckley section of Floyds Fork. A total of 3,600 rainbow were stocked (1,200 fish/stocking) that averaged 9.0-10.0 in.

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

## CENTRAL FISHERIES DISTRICT

## Project B: Technical Guidance

## FINDINGS

A total of 44 pond owners and 56 ponds were visited in 2017. Most common problems were unbalanced fish populations, excessive aquatic plant growth, lack of fish cover, and the presence of undesirable fish species (Table 1). During our 2017 technical guidance sampling, six landowners requested a Fisheries Special Management Permit (FMP) for their ponds. Finally, a total of 343 phone calls, 220 e-mails, and 3 walk-in office visits concerning farm pond problems were handled this year.

Table 1. Technical guidance in the Central Fishery District in 2017.

|  | Paul Hamilton | 8/8/17 | 2 ponds; good fish populations in both ponds | No recommendations |
| Spencer <br> (2) | Louis Miller | 8/9/17 | Fair fish populations | Recovering from fish kill; install aeration system |
|  | Alex Featherstone | 8/17/17 | Good fish populations | Harvest crappie |
| Trimble <br> (1) | Dallas Stucker | 8/17/17 | Unbalanced fish population | Stock LMB |
| Washington <br> (5) | William Mudd | 6/13/17 | Fair fish populations | Stock CCF; add cover |
|  | Travis Mattingly | 6/23/17 | Pond recovering from fish kill | Stock BG |
|  | Jackie Robinson | 7/10/17 | Good fish populations | Stock LMB; add cover |
|  | Michael Jones | 8/14/17 | 2 ponds; Fair fish populations; large pond recovering from fish kill | Pond 1 - Stock LMB, add cover; Pond 2 - stock LMB; add cover |
|  | Andy Matherly | 8/25/17 | 5 ponds; 3 smaller ponds had unbalanced fish populations; 2 larger ponds had good fish populations | 3 smaller pond - stock LMB and CCF; 2 larger ponds stock CCF |

## NORTHEASTERN FISHERIES DISTRICT

Project B: Stream Fishery Surveys - Warmwater Streams
FINDINGS

Sampling conditions for excursions on the South Fork Licking River and Stoner Creek can be found on Table 1 of Project 1.

## South Fork Licking River Sampling

On the May 31 and June 7, 4 pools of the South Fork of the Licking River were sampled for an assessment of the game fish, sunfish and catfish populations. On May 31, the Lair, Airport and Cynthiana Pools were all sampled (3-15-minute runs at each) and on June 7, above the Robinson dam was sampled (2-15-minute runs). In total, 10 different species were collected with the dominant species being smallmouth bass ( $25 \%$ ) followed by largemouth bass ( $22 \%$; Table 1). Catch rates of rock bass were very similar to the average of previous years' sampling (2015, 2012, 2010 and 2006; Table 2). The overall assessment of the rock bass population on these 4 pools of the South Fork Licking River was "Good" (Table 3). Similarly, catch rates of smallmouth bass were near or above average for previous years' sampling efforts (Table 4). The overall assessment of the smallmouth bass population on these four pools of the South Fork Licking River was "Excellent" (Table 5). Finally, catch rates of largemouth bass were all well above the average of previous years' sampling (Table 6) as was the overall assessment of this population, which was rated as "Excellent" (Table 7).

## Stoner Creek Sampling

On June 7, Stoner Creek was sampled for one hour (4-15-minute runs) at Fryman's ramp for an assessment of the game fish, sunfish, and catfish. In total, 4 different fish species were collected with the dominant species being bluegill ( $65 \%$ ) and largemouth bass ( $29 \%$; Table 8 ). Catch rates of largemouth bass were very similar to the average of previous years' sampling (2015, 2012, and 2010; Table 9). The overall assessment of the largemouth bass population on this pool of Stoner Creek was "Excellent" (Table 10).

## NORTHEASTERN FISHERIES DISTRICT

## Project B: Technical Guidance

FINDINGS

Table 1 provides a list of ponds visited (20) in 2017 and our findings and recommendations. In addition to on-site inspections, consultations were rendered via telephone (75-100) and/or written correspondence (4). Most vegetation problems and a few population problems were resolved using email pictures, pond harvest log data or the use of the "Managing Your Farm Ponds" web page. Technical guidance was provided to individuals from all counties in the NEFD. Typical problems responded to include: pond stocking, aquatic vegetation problems, undesirable species, fishing information, fish kills, farm pond management, fish pathogens, water quality, pond construction, structural problems with dams, and pond nuisances.

| County | Name | Date | Findings | Recommendations |
| :---: | :---: | :---: | :---: | :---: |
| Bourbon | T. Poe | 24-Aug | Fish kill, no LMB observed, veg issues | Stock 1150 LMB and 5 grass carp |
|  | C. Smart | 24-Aug | Unbalanced and many underirables | Remove undesirables, stock 75 LMB and 50 CCF |
| Clark | E. Fink <br> J. Kuperstein | $\begin{aligned} & \text { 13-Jun } \\ & \text { 13-Jun } \end{aligned}$ | Fish kill in 2015, veg issues vegetation problem (duckw eed) | Lake is rebounding, apply Rew ard with surfactant for veg control Apply Sonar or Clipper |
| Fleming | K. Arnett <br> C. Brown | $\begin{aligned} & \text { 17-Oct } \\ & \text { 5-May } \end{aligned}$ | Fish kill, unbalanced with veg. Veg problem | remove larger LMB, stock $200 \mathrm{RE}, \mathrm{CuSO}_{4}$ on algae Apply Sonar or Clipper |
| Harrison | J. Guthier | 27-Jun | Unbalanced | Remove 50 CCF and stock 50 4-6" BG |
| Lew is | S. Ship | 28-Aug | P-1: Unbalanced, veg issues <br> $\mathrm{P}-2$ : Veg. issues <br> $\mathrm{P}-3$ : Veg. issues | P-1: Stock 250 LMB, and 20 grass carp <br> P-2: Apply Clipper <br> P-3: Renovate, or apply Rodeo |

| Mason | G. Beckner | 14-Jun | Fish kill, veg issues | stock 25 LMB and 75 BG , continue current veg treatment program |
| Row an | S. James | 10-May | Spatterdock issues | Aooky Rodeo w ith surfactant |
|  | S. Napier | 19-Sep | Unbalanced | Stock 250 BG and remove 20 LMB |
|  | D. Wells | 12-Jun | Unbalanced, veg issues | Stock 225 BG and 10 grass carp |
|  | S. Williams | 18-Sep | Veg issues | Apply Rodeo with surfactant to shoreline, stock 5 grass carp |
| Wolfe | R. How ard | 25-Jul | Unbalanced, veg issues | Stock 125 BG, remove 25 LMB, soil sample |

## SOUTHEASTERN FISHERIES DISTRICT

Project B: Stream Fishery Surveys - Warmwater Streams
FINDINGS

## Upper Cumberland River Basin

The Southeastern Fishery district sampled one location in the Upper Cumberland River Basin in Knox County in 2017. Sampling was conducted to assess the black bass, sunfish, catfish, and walleye populations. During 1.5 hours of shocking, 66 fish were collected, which was comprised of 10 species (Table 1). Due to the low number of fish collected, no further assessments were completed.

Table 1. Length-frequency and CPUE (fish/hr) of selected fish species* collected during 1.5 hours of electrofishing (15-minute runs) in the Barbourville ramp area of the Upper Cumberland River (Knox county) in 2017; standard error is in parantheses.

## SOUTHEASTERN FISHERIES DISTRICT

## Project B: Technical Guidance

## FINDINGS

Details of the technical guidance provided during 2017 are shown in Table 1. Technical guidance was provided through five on-site visits. Additional technical guidance requests were handled over the telephone, or by written correspondence. Topics encountered and responded to included: fish population balance, water quality problems, fish disease, fish stocking, and aquatic vegetation problems.

Several other requests for information (approximately 200) about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone.

Table 1. Technical guidance provided in the Southeastern Fishery District during 2017.

| County | Name of pond or pond owner | Date | Findings | Recommendations |
| :---: | :---: | :---: | :---: | :---: |
| Jackson | Eddie Judd | 6/28 | Balanced fish population; some pondweed present | Continue current management but consider removing crappie from pond; add lime; add cover |
|  | Ryan Judd | 6/28 | Balanced fish population; no bluegill present but redear sunfish observed | Stock bluegill; add cover; add lime; add pea gravel for sunfish spawning areas in shallow water; possibly fertilize |
| Knox | Mark Frazier | 8/24 | Water quality fine | Recommended stocking largemouth bass, bluegill, and channel catfish |
| Pulaski | Melissa Bastin | 8/17 | Pond 1: Good water quality Pond 2: Low alkalinity | Pond 1: No changes recommended <br> Pond 2: Add lime; add cover |
| Whitley | Mr. Sharpe | 6/27 | Pond 1: Bass slightly overcrowded | Pond 1: Remove skinny bass; add cover; consider adding fertilizer in the spring |
|  |  |  | Pond 2: Mostly balanced fish population | Pond 2: Continue current management but harvest any skinny bass if caught; add cover; consider fertilizing |

## EASTERN FISHERY DISTRICT

Project B: Stream Surveys - Warmwater Streams

## FINDINGS

## Sportfish Assessment

Two streams, Levisa Fork and Russell Fork, were sampled with electrofishing boats in spring of 2017. Levisa Fork was sampled at various sites from Pikeville, KY to Prestonsburg, Ky. Future sampling will include further upstream and downstream sites for Levisa Fork as weather permits. Russell Fork was sampled at various sites from just upstream of the Ratliff Hole area in Breaks Interstate Park near KY/VA state line and then downstream to the confluence area of Marrow Bone Creek. The Levisa Fork population assessments included smallmouth bass "Good", rock bass "Poor", spotted bass "Fair", and largemouth bass "Poor". The Russell Fork population assessments included smallmouth bass "Excellent" and rock bass "Good". Sportfish species sampled totaled 14 and 10 from the Levisa Fork and Russell Fork, respectively. Actual sample data for each stream can be reviewed in the Streams Investigation Branch annual performance report.

## STREAM SURVEY CUMBERLANRIVER BASIN

SITE INFORMATION
Date: 8/05/2013

County: Harlan
Drainage Area: $5.5 \mathrm{mi}^{2}$
Stream: Fugitt Creek
Station Number: DOW02044001
Crew: K. Frey, M. Harless

Location: At RT179 bridge in middle reach
Sampling Method: Backpack Electrofisher Longitude: -83.07666
Sampling Time (sec): 1,138 sec

Latitude: $\quad 36.92071$

Quadrangle: Louellen

CHEMICAL AND PHYSICAL CHARACTERISTICS
Surface Temperature: $64.0^{\circ} \mathrm{F}$
pH: N/A
Dissolved Oxygen: N/A mg/l Specific Conductance: $380 \mu \mathrm{~S}$
Fish Shelter: Abundant
Type: Undercut banks, boulders, ledges, logs, brush
Riparian Zone: 10-20 meters
Shade: 75-100\%
Stream Substrate (\%):

1) Pool Area: $\quad 15 \%$ boulders (>12 in), $15 \%$ large rubble ( $6-12 \mathrm{in}$ ), $25 \%$ small rubble ( $3-6 \mathrm{in}$ ), $20 \%$ coarse gravel ( $1-3$ "), $10 \%$ fine gravel ( $0.1-1 \mathrm{in}$ ) $10 \%$ sand, $5 \%$ clay
2) Riffle Area: $\quad 20 \%$ boulder ( $>12 \mathrm{in}$ ), $20 \%$ large rubble ( $6-12 \mathrm{in}$ ), $35 \%$ small rubble ( $3-6 \mathrm{in}$ ), $10 \%$ coarse gravel ( $1-3 \mathrm{in}$ ), $5 \%$ fine gravel ( $0.1-1 \mathrm{in}$ ), $5 \%$ sand, $5 \%$ muck

Pool-Riffle Ratio in Section: $\quad 40 \%$ pool; $60 \%$ riffle

## Other Observations

## EASTERN FISHERY DISTRICT

## Project B: Technical Guidance

## FINDINGS

Details of the technical guidance provided during 2017 are shown in Table 1. Technical guidance (29) was provided by on-site visits (4), over the telephone, or by written correspondence. Topics encountered and responded to included: fish population balance, water quality problems, fish disease, fish stocking, and aquatic vegetation problems.

Several other requests for information about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone.

Table 1. Pond technical guidance in the Eastern Fishery District during 2017.

## Project B: Fish Habitat Improvement - Fish Attractors

| District / Lake | Fish Attractor Sites |
| :---: | :---: |
| Western Fishery District |  |
| Barkley Lake | 71 hardwood units ( 1 tree=1 unit) were used to create new deep water fish attractor sites; 137 hardwood units were used to refurbish existing deep water sites; 900 hardwood units were used to create new shallow water habitat sites; 86 plastic units were used to refurbish old deep water sites; 35 plastic units were used to create new deep water fish attractor sites; 138 Christmast tree units (2 trees=1 unit) were used to create new shallow water habitat sites; Refurbished 153 hardwood stake beds and made 41 new sites (new site $=100$ stakes, refurbished site $=50$ stakes) |
| Energy Lake | Refurbished 2 attractor sites with plastic attractors |
| Kentucky Lake | 88 Christmas tree units (2 trees=1 unit) were used to create new shall water fish habitat sites; 30 plastic units were used to refurbish existing deepwater fish attractors; Refurbished 17 hardwood stake beds and made 4 new sites; planted 30 cypress trees along shoreline; planted 5 acres of rye grass in the drawdown zone |
| Northwestern Fishery District |  |
| Carpenter Lake | 57 scrap vinyl attractors and 3 "large fountain" gas pipe attractors around fishing jetty |
| Nolin River Lake |  |
| Wax Marina area | 52 gas line "spider square" attractors in 1 site |
| Upper Dog Creek | 39 gas line attractor units in 2 sites |
| Rough River Lake |  |
| Little Clifty Creek area | 19 gas line attractors in 1 site (various designs) |
| Cave Creek area | 174 gas line attractors in 3 sites ("cattails" and "snags") |
| Peter Cave Creek area | 40 "snag" gas line attractors in 1 site |
| Kingfisher lakes |  |
| New Kingfisher | 61 scrap vinyl attractors and 17 "large fountain" gas pipe attractors |
| Southwestern Fishery District |  |
| Barren River Lake | 5 new brush sites, 13 refurbished brush sites, 1 new stake bed, 1 new plastics site |
| Green River Lake | 5 new brush sites, 4 refurbished brush site, 1 new pallet trees site, 2 refurbished pallet trees sites |
| Shanty Hollow Lake | 2 new brush piles, 2 refurbished brush piles |
| Three Springs Lake | 4 refurbished brush sites, 1 new brush site |

Project B: Fish Habitat Improvement - Fish Attractors cont.

| District / Lake | Fish Attractor Sites |
| :---: | :---: |
| Central Fishery District |  |
| Beaver Lake | 127 PVC structures (spider ball); 32 brush piles (602 trees); 4 shallow shoreline transects ( 30 trees per transect ( 120 trees); 107 pallet structures ( 3 pallets per unit +2 trees per pallet ( 200 trees); 3 PVC trees; 14 stake beds; 1 hinge cut - fallen trees |
| McNeely Lake | 1 brush pile (15 trees) |
| Northeastern Fishery District |  |
| Cave Run Lake |  |
| Annual habitat work | 2 refurbished brush sites (Christmas tree sites - 100+ trees) |
| Large-scale habitat project work | In the final year of the Cave Run Lake Fish Habitat Project, areas worked on included: the impounded side of Ramey's Creek, Cassidy Point and between and around the Poppin Rock and Bangor Boat ramps. Twenty-one new sites and 1 large reef were created in these areas. Thousands of structures were added to the lake including: Christmas tree bundles, larger cedar trees, pallet structures, stake buckets, plastic pallet structures, concrete culverts, hardwood tree stumps and wooden spool structures. In addition, 6 new sites were created by district staff. Structures were made out of tree bundles, large stumps and wooden crates. |
| Grayson Lake | 4 refurbished brush sites (Christmas tree sites - 150+ trees) |
| Southeastern Fishery District |  |
| Laurel River Lake | 10 brush sites refurbished (30 Christmas trees per site) |
| Eastern Fishery District |  |
| Buckhorn Lake | 6 refurbished shallow water brushpiles ( 60 Christmas trees), 1 new Christmas tree reef ( 40 trees), 10 pallet structures with 15 Christmas trees, 3 plastic tree structures, 4 hinge-cut hardwood trees, 425lbs of winter wheat sowed |
| Carr Creek Lake | 2 refurbished shallow water brushpiles (11 Christmas trees) |
| Dewey Lake | 9 new shallow water brushpiles ( 84 Christmas trees and hardwood), 6 refurbished shallow water brushpiles ( 70 Christmas trees), 5 new deep water brushpile ( 57 Christmas trees and hardwood), 1 refurbished deep water brushpile (15 Christmas trees), 1 new stake bed, 2 refurbished stake beds, 1 hinge-cut tree, 200 lbs wheat seed sowed |
| Fishtrap Lake | 3 refurbished brushpiles deep water (18 Christmas trees) |
| Martins Fork Lake | 1 new Christmas tree brushpile deep water (10 trees) |
| Paintsville Lake | 1 new Christmas tree brushpile ( 15 trees), 10 plastic tree structures, 3 new deep water brushpiles ( 35 Christmas trees \& 20 cedar trees) |
| Yatesville Lake | 2 plastic tree structures, 3 new shallow water brushpiles (25 Christmas trees) |
