Fish Production for all Hatcheries ..... 579

## WESTERN FISHERY DISTRICT

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Sampling conditions for each survey event are listed in Table 1.

## Kentucky Lake

During the spring, 817 black bass were collected by diurnal electrofishing ( 120 PPS, DC current). During this sampling period, 767 largemouth bass ( $66.7 \mathrm{fish} / \mathrm{hr}$ ) were collected from Blood River, Jonathan Creek, Big Bear, and Sugar Bay (Table 2). The catch rates (fish/hr) for largemouth bass between embayments varied ( 52.3 to $88.0 \mathrm{fish} / \mathrm{hr}$ ). This variation could be due to changing weather conditions during the sampling period. The highest catch rates came from Sugar Bay, while catch rates from other embayments may have been negatively affected by fluctuating elevation (Table 1).

The spring bass data was used to complete the lake specific assessment (Table 3). The lake specific assessment suggests that the largemouth bass population rated "Fair". Growth will be reassessed in 2020. The catch rate of age-1 largemouth bass in the sample was low. Future habitat plans will be focused on increasing recruitment of largemouth bass in the reservoir.

The size structure parameters used to assess the fishery by standards set in the Kentucky Lake Fish Management Plan (KLFMP) showed an average catch of (<8.0 in) bass (Table 4). The catch rate of intermediatesize bass (12.0-14.9 in) which was ( $7.9 \mathrm{fish} / \mathrm{hr}$ ) was below the plan recommendation. The catch rate of harvestablesize bass ( $\geq 15.0 \mathrm{in}$ ) was also down from previous years' data, and below the plan recommendation. The catch rate of trophy-size largemouth bass ( $\geq 20.0$ in) was the highest since 2010 , but was still below the KLFMP recommendation.

Proportional Size Distributions (PSD) values were calculated for black bass collected from each embayment sampled during the spring (Table 5). The average PSD and $\mathrm{RSD}_{15}$ values for largemouth bass were 47 and 28 , respectively. These average values were used in the KLFMP assessment. The PSD value was below the assessment preferred range (55-75; Table 4). The $\mathrm{RSD}_{15}$ value was 28 , which falls inside the targeted range ( $\mathrm{RSD}_{15}$ of 20-40).

During October, 370 black bass were collected by diurnal electrofishing ( 120 PPS, DC current) from two embayments; Blood River, and Jonathan Creek (Table 6). Largemouth bass comprised 78\% (44.6 fish/hr) of this sample. During the 2017 fall sample, the largemouth bass catch rate was 50.2 fish $/ \mathrm{hr}$.

Length and weight data were recorded from all bass collected during the fall sample to calculate relative weight values. The mean relative weight for harvestable-size largemouth bass was 90 (Table 8). This value was up from the 2017 estimated relative weight value of 88 , but is still below the preferred range of $95-105$. The relative weight of largemouth bass is one parameter that is being watched as an indicator of the effects of the population of silver and bighead carp in the lake. As silver and bighead carp numbers continue to increase, they could impact the plankton levels and hence the upper levels of the food chain.

Length-weight equations for black bass species at Kentucky Lake are:

$$
\begin{array}{ll}
\text { Largemouth bass } & \log _{10}(\text { weight })=-3.51800+3.18731 \times \log _{10}(\text { length }) \\
\text { Smallmouth bass } & \log _{10}(\text { weight })=-3.60913+3.26384 \times \log _{10}(\text { length })
\end{array}
$$

Otoliths were collected from a subsample of largemouth bass (<12.0 in) during fall sampling in 2018. Otoliths were used to age bass so that the catch rate and growth of age- 0 fish could be evaluated. The catch rate of age-0 largemouth bass during the fall sample was 18.6 fish/hr (Table 7). The 2018 year class appears to be below average, with good growth. The mean length of the age-0 largemouth bass was ( 5.7 in ) at time of capture in the fall.

The age-length key from 2016 was also used to assess the age frequency of largemouth bass > age-1. Few older fish were collected this fall (Table 9). The low catch rates may have been impacted by poor sampling conditions (Table $1)$.

Trap nets were fished for crappie in Blood River and Jonathan Creek embayments for 80 net-nights (nn) during October and November. In addition, Ledbetter Bay was sampled for 40 nn . This is the third time Ledbetter Bay has been sampled for crappie. The combined sampling effort yielded 1,060 crappie ( 8.8 fish $/ \mathrm{nn}$ ), of which 3.3 fish/nn ( $37 \%$ ) were white crappie and 5.6 fish/nn ( $63 \%$ ) were black crappie (Table 10). The Blood River and Jonathan Creek data is listed as "sub-total" on this table. The total catch rate of crappie $>$ age- 0 was 8.4 fish/nn which is below the goal of $20.0 \mathrm{fish} / \mathrm{nn}$ set in the KLFMP (Table 11). The low total catch rate is a reflection of the weak spawns in 2016 and 2017. However, the catch rate of 3.1 fish $/ \mathrm{nn}$ for age- 0 crappie this fall was an encouraging sign of an average spawn in 2018.

The number of crappie $\geq 8.0$ in and $\geq 10.0$ in collected in trap nets was 6.5 and 2.6 fish $/ \mathrm{nn}$, respectively (Table 11). The KLFMP objective for crappie is to maintain a catch rate of at least $10.0 \mathrm{fish} / \mathrm{nn}$ for crappie $\geq 8.0 \mathrm{in}$, and $4.0 \mathrm{fish} / \mathrm{nn}$ for crappie $\geq 10.0 \mathrm{in}$. Neither objective was met this year.

Crappie at Kentucky Lake had typical growth rates in 2017. The growth management objective in the KLFMP is for age- 2 crappie collected in the fall to reach 9.5 inches in length. The average length of the age- 2 crappie collected this year was 9.9 in (Table 11).

Another management objective in the KLFMP is to maintain a catch rate of age-1 crappie of at least 11.0 fish/nn (Table 11). The catch rate for this age group of crappie was $1.6 \mathrm{fish} / \mathrm{nn}$. This is the second lowest catch rate ever recorded at Kentucky Lake and indicates another poor spawn in 2017. For a discussion of the potential impacts of environmental factors on the 2017 spawn, please refer to the 2017 Annual Performance Report.

These parameters are also used as part of the calculation for ranking the crappie fishery at Kentucky Lake. Overall, the crappie population at Kentucky Lake rated "fair" this year (Table 12). The crappie fishery will be assessed with a creel survey in 2020.

The fall trap netting data was used to calculate proportional size distributions and length-weight equations for crappie. PSD and $\mathrm{RSD}_{10}$ values are reported in Table 13. The PSD and $\mathrm{RSD}_{10}$ values are up considerably, and reflect a higher proportion of large-size crappie in the population from a good year class in 2015 and a lower proportion of small fish due to recent weak year classes.

The mean relative weights of keeper-size ( $>10.0$ in) white crappie and black crappie were 94 and 89 , respectively (Table 14). These relative weights are not ideal, but are an improvement over 2017.

Length-weight equations for white and black crappie are listed below.

$$
\begin{array}{ll}
\text { White crappie } & \log _{10}(\text { weight })=-3.67771+3.34450 \times \log _{10} \text { (length) } \\
\text { Black crappie } & \log _{10}(\text { weight })=-3.65733+3.36569 \times \log _{10} \text { (length) }
\end{array}
$$

Tables 15 and 16 list the back-calculated lengths at age for white and black crappie, respectively. The low length at age-1 $(3.4 \mathrm{in})$ is concerning as this may be a reflection of the lower densities of large-bodied zooplankton reported by Hancock Biological Station this year (Hancock Biological Station, unpublished data). The age frequencies for white and black crappie collected are listed in Tables 17 and 18, respectively.

During the spring of 2018 , icthyoplankton sampling was conducted in the Jonathan Creek embayment of Kentucky Lake. Samples were conducted using a rectangular neuston net with a 100-micron mesh size, towed 50 feet behind a boat, at a speed of 1.5 mph . Tow duration was either 5 or 3 minutes depending on an a priori assessment of the expected concentration of icthyoplankton and leptodora to prevent clogging. A General Oceanics flowmeter was attached inside the mouth of the net to record the volume of water sampled during each run. Sampling was begun just after dusk and always followed the same site order. Each sampling event started closest to the main lake site and then progressed farther into the embayment (Appendix A).

Ichthyoplankton samples were preserved immediately in 95\% ethanol and stored in mason jars. All larval fish were sorted and identified to the lowest practical taxon using "A Practical Key to Identify Families, Genera, and Species of Fish Larvae Commonly Collected in Tennessee Reservoirs" (Sammons, 1999); "Preliminary Guide to the Identification of Larval Fishes in the Tennessee River" (TVA, 1976); and "Early Development of Four Cyprinids Native to the Yangtze River, China" (Chapman, and Wang, 2006) (Bolu Yi, et al. 1988). Once identified, fish were counted and measured for total length. In cases of more than 100 individuals in a sample, a random subsample of at least 30 individuals was measured and used to extrapolate the lengths of the fish from the entire sample. Larval crappies were not identified to species due to overlapping myomere counts between both species and their hybrids (Spier and Ackerson, 2004).

The geometric mean and median of the six sample sites were used to evaluate overall densities during each week (Table 19). The standard error and coefficients of variation of the mean and geometric mean were used to evaluate sample accuracy. In 2015 the peak weekly density of crappie occurred on May $12^{\text {th }}$ and was 70.50 crappie $/ 1000 \mathrm{~m}^{3}$. In 2016 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was only 3.88 crappie $/ 1000 \mathrm{~m}^{3}$. In 2017 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was 31.99 crappie $/ 1000 \mathrm{~m}^{3}$. In 2018 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was 27.74 crappie $/ 1000 \mathrm{~m}^{3}$. Based on these results, the spawn of crappie in Jonathan Creek in 2018 appears to have been better than 2016, but not as good as 2015. This will still need to be verified with trap netting in 2019. For the third year in a row the peak weekly density has occurred on May $19^{\text {th }}$.

In order to determine the hatch dates of crappies more precisely, based on growth rates, all crappie that were $8-11 \mathrm{~mm}$ in total length were assumed to represent a one-week cohort (Table 20). Just like last year, crappie in the $8-11 \mathrm{~mm}$ range appeared to be fully recruited to the gear, and were well represented in the sample. It is possible that crappie shorter than 8 mm were not located in the pelagic sample sites yet, and that crappie over 11 mm were more likely to avoid capture. This length range was also chosen because an 8 mm crappie would grow to 11.8 mm in one week (our sample interval), based on a growth rate of 0.67 mm per day after swim up. This was our estimated daily growth rate from daily otolith ring counts of Jonathan Creek crappie collected later in the year (next section).

In addition to weekly cohorts, we also estimated daily cohorts of hatched crappie. All crappie that were captured outside of the $8-11 \mathrm{~mm}$ length range were excluded from the hatch date analysis to minimize the effects of gear bias and the longer exposure to natural mortality of older fish (Table 21). A hatch date was then backcalculated for each individual fish using the assumed growth rate ( $0.67 \mathrm{~mm} /$ day $)$ and the total length of each fish. A total length at hatch $(4 \mathrm{~mm})$ was factored into the regression for hatch date. This technique has been employed in other systems (Mitzner 1991). An incubation period of 95 hours (based on temperature) was also factored into the regression so that the day when fertilization occurred could be estimated.

The estimated hatching densities indicated that the spawn in Jonathan Creek lasted at least 22 days and extended at least until the middle of May (Table 21). The truncated spawning period was likely influenced by the rapid rise in water temperature this year. Because of our limited larval sampling window, we cannot be sure that crappie did not spawn before or after our sampling window. The literature reports most crappie spawns to be relatively short (1-2 months; Mitzner 1991 and Travnichek, et. al.1996). A strong peak in spawning activity was observed during the first week of May immediately following a brief lake elevation rise of 2 feet above normal. The lake was up to summer pool (359.0) by 17-April, but larval sampling did not indicate any successful spawning activity until 23-April when the lake was rising above summer pool elevation. The highest numbers of crappie were spawned after the lake returned to summer pool elevation and water temps climbed into the 60 's. Water temperatures quickly rose this year and the spawning activity appeared to end as temperarures reached the high 70's. Similar to prior-year surveys we found much higher densities of larval crappie farther into the embayment (Table 19; Appendix A).

In June 2018 an effort was made to capture YOY crappie using a benthic otter trawl. Crappie were identified to species using dorsal fin counts, and a subsample of otoliths was collected from approximately 200 crappie for daily ring count analysis. The subsample was collected randomly without regard to crappie species or size. Crappie trawling has typically been conducted in the fall to assess year class strength. However, an earlier sample was necessary for accurate daily ring counts since those counts can become unreliable in fish >100 days old
(Sweatman and Kohler, 1991). Trawling runs were conducted in Jonathan Creek because this is where the larval sampling occurred during the spring. To evaluate whether hatching periods and growth rates differed by embayment, trawling was also conducted at Blood River embayment. Otoliths were mounted convex side down using thermoplastic cement, sanded with 1200 grit sandpaper, and polished with 0.3 -micron alumina powder.

Each otolith was aged independently by two readers using a compound microscope at 100x-400x magnification. Reader agreement was typically within 1-2 days, but if the difference between readers was less than $10 \%$ of the fish's age, the counts were averaged and accepted. In 2018, no fish were excluded from Johnathan Creek or Blood River based on reader disagreement. We were able to estimate an average daily growth rate for both species of crappie by using the equation described by Sweatman and Kohler (1991) [(total length mm-4mm)/\#days old-4 days]. This growth rate estimate was coupled with the larval data to provide an accurate estimate of crappie hatch dates in Jonathan Creek as described earlier (Table 21). There is no way to practically differentiate between crappie species in the larval samples. Thusly, the estimated growth rate used in the larval hatch date back calculation combined both species together.

Differences in growth rates and hatch dates between species and embayments were initially compared with an F-test for variances. Due to unequal variances, the hatch dates and growth rates were then compared using Ttests for unequal variances. In Jonathan Creek the mean hatch date of white crappie (May $\left.13^{\text {th }}\right)(\mathrm{n}=78)$ was significantly later than the mean hatch date of black crappie (May $\left.10^{\mathrm{th}}\right)(\mathrm{n}=26)(\mathrm{t}=2.7 \mathrm{df}=37 \mathrm{P}=.005)$ (Table 22). Daily growth rates for black crappie were statistically significantly higher ( $0.70 \mathrm{~mm} /$ day $)$ than white crappie ( $0.067 \mathrm{~mm} /$ day $)(\mathrm{t}=1.68 \mathrm{df}=45 \mathrm{P}=0.049)$.

In Blood River, the average black crappie hatched significantly sooner (May $\left.10^{\text {th }}\right)(\mathrm{n}=9)$ than the average white crappie (May $\left.15^{\text {th }}\right)(\mathrm{n}=89)(\mathrm{t}=2.43 \mathrm{df}=9 \mathrm{P}=<0.02)$ (Table 22). Daily growth rates for black crappie were statistically significantly higher $(0.71 \mathrm{~mm} / \mathrm{day})$ than white crappie $(.067 \mathrm{~mm} / \mathrm{day})(\mathrm{t}=2.71 \mathrm{df}=14 \mathrm{P}=0.0084)$.

When both species were grouped together, crappie in Blood River and Jonathan Creek each had an average daily growth rate of $0.68 \mathrm{~mm} /$ day. The average crappie in Blood River hatched significantly later (May $14^{\text {th }}$ ), than the average crappie in Jonathan Creek (May $\left.12^{\text {th }}\right)(\mathrm{t}=3.17 \mathrm{df}=196 \mathrm{P}=<0.0009)$. The slight difference in hatch dates may be due to differences in embayment morphology or unknown temperature differences, but was more likely influenced by the higher proportion of white crappie collected in Blood River.

The catfish population was sampled at Kentucky Lake during June by using low pulse (15 PPS) electrofishing along the main lake river channel. A chase boat was utilized to help collect catfish around the electrofishing boat. One dipper was used in each boat. A total of 69 catfish were collected during 29 electrofishing runs (Table 23). Each run lasted 300 seconds, for a total sample time of 2.4 hours over a three-day period. Of the samples, blue catfish had the highest catch rate at 23.8 fish $/ \mathrm{hr}$, and made up $83 \%$ of the catfish collected. The catch rate was much lower than observed in most previous years, but consistent with last year's results. Relative weight values are listed in Table 24. The relative weight values are all high, suggesting the fish are healthy.

Otoliths were collected during catfish sampling in 2014. That age data was applied to the 2018 dataset to calculate age frequencies. Age frequency data for blue catfish is presented in Table 25.

## Lake Barkley

Black bass were collected by diurnal electrofishing (120 PPS, DC current) during the spring at sampling sites historically used on Lake Barkley. A total of 513 black bass were collected at a rate of $48.9 \mathrm{fish} / \mathrm{hr}$ (Table 26). Spotted and smallmouth bass accounted for about $8 \%$ of the total black bass sampled. Catch rates declined slightly over last year, and were still below the long-term average. At best, it was felt that sampling yielded only fair results. Although sampling during some years $(2011,2012,2016)$ was believed to be affected by weather conditions, the lack of a strong spawn between 2009 and 2016 has likely reduced the overall numbers of bass in Lake Barkley. This might explain the drop in intermediate and large-size bass during the most recent study. The largemouth bass catch rate was 44.9 fish $/ \mathrm{hr}$ which falls below the ten-year average of 83.4 fish/hr (Table 27).

The overall PSD and RSD $_{15}$ values for largemouth bass at Lake Barkley, along with values for individual embayments are listed in Table 28. The PSD value (67) is within the objective goal (PSD of 55-75) established in the Barkley Lake Fish Management Plan (BLFMP). This value indicates a bass fishery with a balanced size structure. The $\operatorname{RSD}_{15}$ (51) was higher than the set goal (20-40). This higher value indicates that the bass population is slightly skewed toward larger fish. The spring catch rates of small ( $\leq 8.0 \mathrm{in}$ ), medium (8.0-14.9 in), and larger ( $\geq 15.0 \mathrm{in}$ ) largemouth bass all declined this year and remain lower than historical averages (Table 27).

The lake specific assessment score for Lake Barkley was "fair" (Table 29). The score was "good" for several years prior to 2010. Flood conditions in 2010, 2011, and 2013 as well as drought conditions in 2012 likely influenced sampling resulting in spurious lower ratings for these years. The fishery showed improvement in these ratings in 2017 and was again rated as "good". However, in 2018, low catch rates of 12.0- to 14.9-in largemouth bass and largemouth bass $\geq 15.0$ in negatively affected the score. We calculated age- 3 largemouth bass mean length at capture as outlined by Murphy and Willis (1996) in addition to the traditional method. This method uses a weighted average based on the age-length key and includes all sampled fish per age class. Although differences are slight, we do feel that this calculation more accurately describes this metric, as all spring-sampled bass are included in the calculation. The annual mortality of largemouth bass older than a year was $26 \%$ as determined using catchcurve regression of fall-caught largemouth (Table 29).

Black bass were sampled in October to collect length-weight data to assess condition factors and to determine the strength of the 2018 year-class. A total of 271 bass were collected, with $89 \%$ being largemouth bass (Table 30). Largemouth bass were caught at a rate of $34.7 \mathrm{fish} / \mathrm{hr}$. This catch rate was much lower than previous years. Unseasonably warm water temperatures for the first couple weeks of October likely affected catch rates this year. Relative weights were determined for all bass, but very few spotted and smallmouth bass were collected (Table
31). The relative weight for harvestable-size ( $\geq 15.0 \mathrm{in}$ ) largemouth bass was 102.5 . The length-weight equation for largemouth bass at Lake Barkley is:

$$
\operatorname{Largemouth~BassLog}_{10}(\text { weight })=-3.59927+3.29547 \times \log _{10}(\text { length })
$$

During 2015, largemouth bass age and growth data was collected in the fall instead of the spring. This statewide change in sampling procedure was made to simplify the reading of otoliths by eliminating the need to add an unseen annulus onto the outer edge. Age and growth data collected in the fall of 2015 were coupled with fall 2018 data to yield an estimate of the age distribution for largemouth bass. Catch rates for fall-caught fish by ageclass are shown in Table 32. Ages ranged from 0-11 and the most abundant age-class was age-0. Moderate catch rates of age- 1 and age- 2 bass were also observed.

Mean length of the age- 0 cohort of largemouth bass was 6.3 in (Table 33). It has been suggested that bass that reach at least 5.0 in by the fall will have a better chance of survival during their first winter. This year's catch rate of age- 0 largemouth bass ( $9.6 \mathrm{fish} / \mathrm{hr}$ ) was below average.

Trap nets were fished for crappie in Little River and Donaldson Creek embayments for 79 net-nights (nn) during October and November. A total of 778 crappie were collected at a rate of 9.9 fish/nn (Table 34). Additionally, Crooked Creek (LBL) was sampled for 40 net-nights. Crooked Creek provided a reasonable sample ( $6.4 \mathrm{fish} / \mathrm{nn}$ ), and will be sampled again in the future if possible. Eddy Bay was not sampled this year but may be added back to the sampling schedule in upcoming surveys if possible.

White crappie accounted for $70 \%$ of the total catch, and were caught at $5.8 \mathrm{fish} / \mathrm{nn}$. Black crappie accounted for the remaining $30 \%$ of the total catch, and were collected at a rate of $2.9 \mathrm{fish} / \mathrm{nn}$ (Table 34). Little River contained lower proportions of black crappie than Donaldson Creek and Crooked Creek. The mean relative weights for keeper-size (>10.0 in) black and white crappie were 99 and 102, respectively (Table 35). For historical comparisons, only data from Little River and Donaldson Creek were used in the standardized population parameters of Lake Barkley crappie in Table 36. The catch rate of harvestable-size ( $\geq 10.0 \mathrm{in}$ ) crappie was $0.6 \mathrm{fish} / \mathrm{nn}$, which is lower than the ten-year average of $1.6 \mathrm{fish} / \mathrm{nn}$. The catch rate of quality-size ( $\geq 8.0 \mathrm{in}$ ) crappie was $1.3 \mathrm{fish} / \mathrm{nn}$, which is below the management objective ( $4.0 \mathrm{fish} / \mathrm{nn}$ ) set in the BLFMP. The catch rate of age- 1 crappie ( 2.0 fish/nn) was also below the management objective ( $5.0 \mathrm{fish} / \mathrm{nn}$ ).

The length-weight equations of white and black crappie from Lake Barkley are:

$$
\begin{array}{ll}
\text { White crappie } & \log _{10}(\text { weight })=-3.95707+3.67571 \times \log _{10} \text { (length) } \\
\text { Black crappie } & \log _{10}(\text { weight })=-3.77626+3.56237 \times \log _{10} \text { (length) }
\end{array}
$$

Crappie collected in trap nets were used to determine stock densities. The PSD (64) and $\operatorname{RSD}_{10}$ (32) of white crappie were similar to the 2016 and 2017 samples, and suggests a balanced size distribution of white crappie (Table 37). The PSD (29) value of black crappie decreased from 2016 and 2017 samples, suggesting a shift towards more small fish in the population in 2018. The $\operatorname{RSD}_{10}(11)$ value of black crappie was identical to last year.

Otoliths from 263 crappie were used for age and growth analysis. Ages ranged from 0-4 years for white crappie and 0-3 years for black crappie (Tables 38 and 39). Growth continues to be good as crappie reached 10.0 in between age 1 and 2. The average lengths of age 2 white crappie and black crappie at capture were 11.8 in and 10.9 in, respectively (Table 36). In addition, we calculated age-2 crappie mean length at capture as outlined by Murphy and Willis (1996) going back to 2009. This method uses a weighted average based on the age-length key and includes all sampled fish per age class. Although differences are slight, we do feel that this calculation more accurately describes this metric, as all crappie are included in the calculation (Table 36).

Age frequencies were estimated by combining catch data with age data. Nearly three quarters of white crappies captured were age- 0 fish while age- 1 fish made up another $22 \%$ of the catch, suggesting average year classes in 2017 and 2018 and a weak 2016 year class (Table 40). Similar to last year, very few white crappie older than age- 3 were collected which contrasts our data suggesting relatively strong spawns in 2014 and 2015. The black crappie catch in Little River and Donaldson Creek was also dominated by age-0 fish, suggesting at least an average spawn in 2018 (Table 41).

Assessment of the crappie population yielded a rating of "Fair" at Lake Barkley in 2017 (Table 42). The catch of age-1 crappie was similar to 2017 but remains below the 10 -year average; however, catches of age- 0 fish were above average. While the catch rate of crappie $\geq 8.0$ in was at a 10 year low in 2018 , the average length of age2 fish was at a 10-year high. As expected, the population of larger fish dropped in 2018, due to combined effects of mortality of the strong 2014 year class and in response to the weak 2016 year class. We are hopeful to see more large fish in the next couple of years following the potentially good spawn in 2018.

The catfish population was sampled at Lake Barkley during June-July by using low-pulse ( 15 PPS ) boat electrofishing with one dipper along the main lake river channel. A chase boat with one dipper was also utilized to help collect catfish around the electrofishing boat for a total of two dippers. A total of 1154 catfish were collected during the 52 electrofishing runs made (Table 43). Each run lasted 300 seconds, for a total sample time of 4.3 hours over a four-day period. Of the sample, blue catfish had the highest catch rate at 244.8 fish $/ \mathrm{hr}$, and made up $92 \%$ of the catfish collected. Flathead catfish and channel catfish are likely underrepresented using this method as these fish were often observed, but were much harder to approach and dip than blue catfish. Relative weight values were all within or greater than ideal values of 95-105 and are listed in Table 44.

Age data from catfish collected in 2014 were used to calculate an age frequency for catfish collected during 2018. Age frequency data is presented in Table 45 for blue catfish and Table 46 for channel catfish. These tables should be used with caution as some larger size classes were unrepresented in 2014, and were therefore excluded from this age frequency data. Of the blue catfish, almost $80 \%$ of the sample consisted of age 1-3 fish.

## Lake Barkley Creel Survey

A random, non-uniform probability, roving creel survey was conducted on the Kentucky portion (45,600 a) of Lake Barkley from 16 February to 30 November 2018. The Kentucky portion of the lake was divided into eight creel areas (Appendix B). The survey was conducted five days per week, six hours per day. One hour each day was randomly chosen to conduct an angler count. The remaining five hours were dedicated to creeling anglers actively fishing. The overall temporal sampling scheme was twenty days per month, consisting of six weekend days and fourteen weekdays. Varying time period probabilities were assigned to each month. Higher geographic probabilities, resulting in more frequent interviews, were assigned to the Little River and Eddy Creek areas from March through May, and October and November, than were assigned to the other six areas. Equal probabilities were assigned to all areas from June to September. An angler attitude questionnaire concerning fishing on Lake Barkley was conducted by the creel clerk throughout the survey period (Appendix C).

During the 2018 creel, the typical angler was a male ( $88 \%$ ) resident ( $75 \%$ ) who was casting ( $57 \%$ ) or still fishing ( $40 \%$ ) from a boat ( $85 \%$ ) (Table 47). Of the crappie anglers, $42 \%$ used a spider rig (defined as 3 or more poles per angler) for fishing. The average fishing trip for all anglers was 4.3 hours. There was a slight increase in the number of trips of $(94,732)$ since the last creel survey in 2016 . However, this is the second lowest number of trips ever recorded in a Lake Barkley creel survey, and represents only a $6 \%$ increase since 2016. Anglers also caught a record low number of fish $(364,496)$. Length frequencies of all harvested or released fish are presented in Table 48.

Table 49 provides fish catch and harvest statistics for the 2018 creel survey. Crappie anglers accounted for $20 \%$ of fishing trips to Lake Barkley in 2018 ( $24 \%$ in 2016, $17 \%$ in 2012). Estimated catch and harvest rates for crappie were below average. Crappie anglers caught 1.02 fish $/ \mathrm{hr}$ which is just below the long-term average of 1.14 fish $/ \mathrm{hr}$. However, of the crappie caught, $61 \%$ were above the harvestable size (Table 50). This higher proportion of legal-size crappie corresponds to fall trap netting data that suggest good year classes in 2014 and 2015. Ninety percent of crappie were caught from March - May (Table 51). As part of our efforts to evaluate harvest by method, crappie anglers were recorded as using the following methods: casting, still fishing (1-2 poles), spider rigging ( 3 poles), spider rigging ( $4-5$ poles), spider rigging ( $>5$ poles). During this survey, $42 \%$ of crappie anglers used 3 or
more poles. The percentage of crappie anglers using (>5 poles) increased to $19 \%$ in 2018 compared to only $8 \%$ of crappie anglers in 2016 (Table 52).

Black bass anglers accounted for $45 \%$ of all fishing trips to Lake Barkley during 2018 (Table 49). There were 42,476 black bass fishing trips in the 2018 creel, which is below the long-term average for Lake Barkley. During older surveys, any bass that was currently in the livewell was recorded as harvested. However, during recent surveys, anglers with bass in the livewell were asked if they intended to release them at the end of the day. In all cases, tournament anglers indicated that they intended to release their fish after the weigh-in. Additionally some non-tournament anglers simply chose to keep fish in the livewell for photographic or "mock tournament" purposes, but indicated that they would release them at the end of the day. As a comparison with previous surveys, bass kept in livewells by anglers were reported as harvested, even though they would be released at the end of the day. The harvest rate, which included tournament bass and "mock tournament" bass, was estimated to be 0.05 bass per hour for anglers actually targeting bass (Table 53). However, when tournament and "mock tournament" harvested bass were removed from the actual harvest, the harvest rate dropped to $0.003 \mathrm{bass} / \mathrm{hr}$. Largemouth bass accounted for $84 \%$ of the harvested black bass while smallmouth bass accounted for the remaining $16 \%$ of harvest. (Table 54).

About 6\% of all trips to Lake Barkley in 2018 targeted panfish (Table 49). This value approximately equals the historic average; however, it is lower than each creel survey at Lake Barkley going back to 1999. Catch and harvest rates of panfish were well below long-term averages. About $74 \%$ of the panfish were harvested during May (Table 55). Bluegill and redear sunfish accounted for $99.7 \%$ of the panfish harvested. Of the bluegill, only $56 \%$ of the fish caught were harvested, while $81 \%$ of the redear sunfish caught were harvested (Table 56). Although fish are observed by the creel clerk whenever possible, it is possible that a some percentage of misidentification took place by anglers when reporting panfish catch.

Catfish anglers accounted for $17 \%$ of all fishing trips on Lake Barkley in 2018 (Table 49). The number of trips for catfish was slightly below the long-term average but was an increase from the 2016 creel on Lake Barkley. The catfish fishery remains highly harvest oriented as $82 \%$ of the catfish caught were harvested (Table 57). Harvest rates for fish (>12.0 in) were $96 \%$ and $87 \%$ for blue catfish and channel catfish, respectively. To further understand the motivations of catfish anglers, we asked a subsample of anglers "If you fish for catfish in Lake Barkley, which is more important to you: catching trophy fish, or catching more keeper size fish to eat?". Only $10 \%$ of catfish anglers responded that they considered catching trophy fish to be more important (Appendix C). However, an additional $28 \%$ responded that both were equally important. While catfish management has traditionally pursued maximum sustainable yield, future investigations should attempt to monitor the motivations of catfish anglers to ensure management goals reflect the goals of anglers. The highest monthly total of catfish caught was reported in May (Table 58). These were likely anglers targeting channel catfish in the embayments. The total catch of channel catfish was more than double the catch of blue catfish (Table 57).

Only about $2 \%$ of the anglers fishing Lake Barkley during 2018 sought Morone (Table 49). This group includes; white bass, yellow bass, striped bass and hybrids. In an effort to quantify angler goals, this year we added a target code for anglers specifically targeting yellow bass. No anglers reported that they were specifically targeting yellow bass. Yellow bass represented approximately $77 \%$ of the Morones caught and made up $64 \%$ of the Morone harvest. However, white bass accounted for $76 \%$ of the harvested Morone weight. About $78 \%$ of yellow bass were released after being caught (Table 59). While the majority of yellow bass were released, $77 \%$ of the largest yellow bass caught (8.0-10.0 in) were harvested (Table 48). The harvest rates drop to $51 \%$ for 7.0 -in yellow bass with only $11 \%$ of yellow bass (<7.0 in) harvested. Although purely speculative, harvest rates might be increased in the future by encouraging harvest with social influencing or even by creating a length limit of ( 6.0 in ) so that anglers begin to view harvesting legal size yellow bass as a goal. Based on monthly catch rates, the peak Morone fishing activity occurs during the summer months (Table 60).

## Lake Barkley Winter Creel Survey

A random uniform probability roving creel survey was conducted in Eddy Creek (Appendix B, area 3), Little River (Appendix B, area 5), and the Kuttawa area of northern Lake Barkley (Appendix B, area 2) $(17,090$ acres) on Lake Barkley from 01 December 2018 through 15 February 2019. The primary objective of the survey was to assess the wintertime crappie fishery. The survey was conducted 15 days per month, six hours per day. One hour each day was randomly chosen to conduct an angler count. The remaining five hours was dedicated to creeling
anglers actively fishing. The overall temporal sampling scheme was 15 days per month, consisting of five weekend days and 10 weekdays. Varying time period probabilities were assigned to each month. Equal probabilities were assigned to all three areas. An angler attitude questionnaire concerning fishing on Lake Barkley was conducted by the creel clerk throughout the survey period (Appendix C).

During the winter creel, the typical angler was a male ( $96 \%$ ) resident ( $99 \%$ ) who was casting for crappie ( $60 \%$ ) from a boat ( $77 \%$ ) (Table 61). These results suggest that the wintertime crappie fishery draws much fewer non-resident anglers than was observed throughout the warmer months. Of the crappie anglers, $33 \%$ used a spider rig (defined as 3 or more poles per angler) for fishing. The average fishing trip for all anglers was 2.3 hours. Length frequencies of all harvested or released fish are given in Table 62.

Table 63 provides fish catch and harvest statistics for the 2018-2019 winter creel survey. Crappie anglers accounted for $20 \%$ of fishing trips to Lake Barkley in 2018 ( $24 \%$ in 2016, $17 \%$ in 2012) (Table 49). However, the winter creel showed that crappie anglers accounted for a much higher percentage of the fishing trips ( $64 \%$; Table 63). Wintertime crappie anglers caught ( 0.75 fish $/ \mathrm{hr}$ ) which was slightly lower than the rate ( $1.01 \mathrm{fish} / \mathrm{hr}$ ) observed in the warmer months of 2018 . Of the crappie caught, $34 \%$ were under harvestable size (Table 64). The catch rates for crappie were highest during January (Table 65). Low sample size (5 total interviews, only one interviewed angler targeting crappie) in the first half of February likely contributed to the low effort during that month. As part of our efforts to evaluate harvest by method, crappie anglers were recorded as using the following methods: casting, still fishing ( $1-2$ poles), spider rigging ( 3 poles), spider rigging ( $4-5$ poles), spider rigging ( $>5$ poles). During this survey, $33 \%$ of crappie anglers used 3 or more poles. This percentage is lower than that observed in warmer months of 2018 ( $42 \%$ ).

Black bass anglers accounted for $19.5 \%$ of all fishing trips to Lake Barkley during the 2018-2019 winter creel (Table 63). During older surveys, any bass that was currently in the livewell was recorded as harvested. However, during recent surveys, anglers with bass in the livewell were asked if they intended to release them at the end of the day. In all cases, tournament anglers indicated that they intended to release their fish after the weigh-in. Additionally some non-tournament anglers simply chose to keep fish in the livewell for photographic or "mock tournament" purposes, but indicated that they would release them at the end of the day. As a comparison with previous surveys, bass kept in livewells by anglers were reported as harvested, even though they would be released at the end of the day. Throughout the entire winter survey, no angler reported any harvest of black basses (Tables 66 and 67).

About 6\% of all trips were taken to catch panfish in Lake Barkley during 2018 (Table 49), whereas about $3 \%$ of all trips were taken to catch panfish in the 2018-2019 winter creel (Table 63). However, only one angler accounts for this targeted panfish angling. Such low sample size makes accurate extrapolation of data difficult, if not impossible, but it seems that the wintertime panfish fishery is very small (Tables 68 and 69).

Catfish anglers accounted for $17 \%$ of all fishing trips on Lake Barkley in 2018 (Table 49), whereas about $14 \%$ of all trips were taken to catch catfish in the 2018-2019 winter creel (Table 63). The catch of blue catfish more than doubled the catch of channel catfish, while no flathead catfish were caught. Catch and harvest of catfish was only observed in December; however, sample size is quite low (Tables 70 and 71).

Only about 3\% of the anglers fishing Lake Barkley during 2018 sought Morones (Table 49). This group includes; white bass, yellow bass, striped bass, and hybrids. During the 2018-2019 winter creel there were no anglers who indicated that they were targeting Morones (Table 63). Some white bass and yellow bass were harvested while a few striped bass were also caught during the winter creel (Tables 72 and 73).

## Lake Beshear

Largemouth bass were collected by diurnal electrofishing (120 PPS, DC current) during April at Lake Beshear. One-hundred and forty-nine largemouth bass were collected at a rate of 59.6 fish/hr. (Table 74). The catch rate of harvestable-size ( $\geq 12.0 \mathrm{in}$ ) largemouth bass was $43.6 \mathrm{fish} / \mathrm{hr}$ (Table 75). This year's sample falls slightly below the objective in the Lake Beshear Fish Management Plan (LBFMP) to maintain a catch rate of at least 45.0 fish $/ \mathrm{hr}$ for harvestable-sized largemouth bass. The catch of age- 1 fish was low this year ( $6.0 \mathrm{fish} / \mathrm{hr}$ ), but low
recruitment is typical in Lake Beshear. Other objectives are to maintain high catch rates of bass $\geq 15.0$ and $\geq 20.0 \mathrm{in}$. Ideally, these catch rates should be greater than 30.0 and $3.0 \mathrm{fish} / \mathrm{hr}$, respectively. The catch rates for these length groups of bass were above the management objectives. Lake Beshear continues to have a quality bass fishery with high numbers of bass $\geq 15.0$ in. The fishery rated as "good" in 2018 (Table 76).

Largemouth bass were collected by diurnal electrofishing (120 PPS, DC current) in October (Table 74). The catch rate ( 86.8 fish $/ \mathrm{hr}$ ) was an improvement over last year, but the catch was skewed towards smaller fish. Sampling conditions were reported to be fair, although water temperatures were still around 80 degrees. Relative weight data suggests that larger bass ( $\geq 15.0 \mathrm{in}$ ) are healthy with regard to their length-weight ratio. The average relative weight value was 98 for these larger bass and 85 for all sizes of bass. The length-weight equation for largemouth bass at Lake Beshear is:

$$
\log _{10}(\text { weight })=-3.53848+3.17297 \times \log _{10}(\text { length })
$$

Otoliths were removed from a subsample of largemouth bass $\leq 10.0$ in to determine the mean fall length of the age- 0 cohort, and to determine their catch rate. The catch rate for age-0 largemouth bass was 50.7 fish $/ \mathrm{hr}$ (Table 77). The average length of an age- 0 bass was 5.3 in .

The catfish population at Lake Beshear was sampled in June using trotlines and tandem hoopnets. A total of 231 channel catfish were collected in the hoopnets for a catch rate of 57.8 fish/set, but the sample variation was highly influenced by one extraordinarily productive net location (Table 78). A total of 25 channel catfish and 10 blue catfish were collected on trotlines baited with cut bait (Table 79). The mean relative weights for channel catfish and blue catfish were 96 and 87, respectively (Table 80). Relative weights for larger fish were in excess of 100, which indicates that current stocking levels are appropriate.

Otoliths were removed from a subsample of fish to assess growth rates and monitor for successful natural spawns (Tables 81 and 82). Although sample size was low, the mean length of age-3 blue catfish was around 14.0 in (Table 83). Growth rates of channel catfish have improved since changing the stocking schedule to a 3 -year rotation (Table 84). The mean length at age- 3 from earlier channel catfish stockings was around ( 8.0 in), but the more recent stockings averaged around ( 15.0 in ). Given the lack of significant natural reproduction, a mortality estimate was not appropriate. However, survival appears to be adequate based on the presence of older fish in the system (Tables 83 and 84).

## Lake Pennyrile

Electrofishing for all species of sportfish in Lake Pennyrile was conducted on 25 April, 2018. Onehundred and one largemouth bass were captured at a rate of 101.0 fish/hr (Table 85). This catch rate is slightly below the 10 -year average of 111.0 fish $/ \mathrm{hr}$ (Table 86). The majority of largemouth bass were still below 15.0 in . Only two ( $2 \%$ ) bass over 15.0 in were captured in this year's sample, while only nine (9\%) were 12.0 in or larger. The catch rate of fish $\geq 15.0$ in ( $2.0 \mathrm{fish} / \mathrm{hr}$ ) is slightly below the 10 -year average of $3.1 \mathrm{fish} / \mathrm{hr}$ (Table 86). The catch rate of largemouth bass $8.0-11.9$ in was $63.0 \mathrm{fish} / \mathrm{hr}$, which falls below the management objective of $80.0 \mathrm{fish} / \mathrm{hr}$. A high catch rate of intermediate-size largemouth bass is desirable in order to maintain good numbers of large sunfish in this system.

The catch rate of bluegill $\geq 8.0$ in was above average at $27.0 \mathrm{fish} / \mathrm{hr}$. (Table 87). The catch rate for largesize ( $\geq 8.0 \mathrm{in}$ ) redear was also above average at $27.0 \mathrm{fish} / \mathrm{hr}$. Over the past four years, the catch rate of large bluegill and redear sunfish has been above the 10-year average. The most probable explanation for these high catch rates is that there are too few large piscivorous predators and too little angler harvest to limit the abundance of large sunfish in the system.

PSD and RSD values for largemouth bass, bluegill and redear sunfish are listed in Table 88. The PSD value for largemouth bass suggests a population skewed toward small bass. The largemouth bass fishery is likely stunted which is our goal when managing for large panfish. PSD's and RSD's are generally above average for bluegill and redear, and skewed toward more large, adult fish.

An accurate lake specific assessment for Lake Pennyrile largemouth bass has not been possible in recent years without good age and growth estimates. In 2011 a small sample of bass were aged. In 2011, the largemouth bass population was rated as "fair" (Table 89). In more recent years, assessments have been completed using the age data from 2011. Due to the shift in management focus towards trophy sunfish, it is unlikely that largemouth bass populations will ever be rated highly.

A voluntary creel survey was also conducted at Lake Pennyrile from March 15, 2018-March 1, 2019. Creel survey cards and dropoff boxes were placed at the only 4 entry points around the lake. Cards were also made available inside the lodge facilities and the guest rooms at Lake Pennyrile State Park. The original survey design called for park staff to conduct a daily angler count on a randomized schedule, but park staff did not follow through with their part of the plan as designed.

Based on completed or mostly completed voluntary card returns ( $n=67$ ), the majority ( $69 \%$ ) of angler trips occurred during April and May (Table 90). Seventy-nine percent of anglers were Kentucky residents and the majority were fishing from the bank.

Length distributions for sportfish generally aligned with the results of our electrofishing survey. Seventythree percent of bluegill reported during the creel survey were $>6.0$ in (Table 91) compared to $64 \%$ being $>6.0$ in during our spring electrofishing survey (Table 87). The reported catch of black bass indicated a population skewed towards small fish, but interestingly, $83 \%$ of the legal size ( $>12.0 \mathrm{in}$ ) bass were harvested. Few anglers reported catching catfish, despite $24 \%$ of anglers indicating they were targeting catfish. The low catfish catch strongly supports the stocking of more catfish in the future.

Catch rates for all anglers who reported their effort are provided in Table 92. Catch rates for anglers targeting specific species are reported in Table 93. The number of fishing trips and effort (angler hours) were highest for black bass (36 and 105.9, respectively) (Table 94). However, bluegill and redear effort was also high. Anglers often indicated that they intended to target multiple species during the same trip, therefore targeted effort and catch rates must be interpreted with caution. Currently the management plan for Lake Pennyrile is intended to improve the size structure of the sunfish population by maintaining a stunted overabundant largemouth bass population. Based on the results of this survey, we may need to consider some management actions such as targeted bass removal that would improve the largemouth bass size structure as well.

Anglers submitted 25 general comments during the Lake Pennyrile creel survey (Appendix D). Several of the comments suggested increasing access to the lake for fishing from the bank or creating a launch site for personal watercraft. Many other anglers, especially catfish anglers, indicated poor or slow fishing and suggested stocking the lake with catfish. The remaining comments largely suggested good fishing and a relaxing atmosphere.

## Ballard County Wildlife Management Area Lakes

During April-May of 2018, several Ballard County Wildlife Management Area lakes (Little Turner, Gravel Pit, Shelby, and Castor) were sampled with electrofishing (2-900-second runs at each lake). Little Turner, Shelby, and Castor are old oxbows of the Ohio River, which are primarily managed for waterfowl. The fisheries in these systems fluctuate greatly due to the nearly annual connection with the river during flood events. Each of the lakes shows potential for good panfishing, despite low numbers of bluegill >6.0 in (Table 95).

Gravel Pit Lake was created as a public fishing opportunity that would not routinely be connected to the river during flood events. This lake had good numbers of large panfish and catfish (Table 95). The largemouth bass population is stunted, but provides a great opportunity to catch high numbers of fish. This lake will be monitored more routinely in the future.

Table 1. 2018 yearly summary of sampling conditions by waterbody, species sampled, and date.

| Water body | Location | Species | Date | Effort | Gear | Weather | Water temp. ${ }^{\circ} \mathrm{F}$ | Water level | Secchi <br> (in) | Water conditions | Pertinent sampling comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Average | 5.5 |  | 38.4 |  | 25.8 |  | 31.6 |  |

${ }^{\text {A }}$ Data collected by fall (October) diurnal electrofishing. Mean lengths were determined by analysis of otoliths removed from a subsample of LMB <8.0 in and extrapolated to the entire catch of the fall sample. Since 2010, bass up to 10.0 in have been collected for analysis.
${ }^{B}$ Data from diurnal electrofishing samples collected the following spring (April/May).
*2010, 2011 and 2013 spring data was poor due to high water levels.
*2012 spring data was poor due to low water levels.
Data from 1990 to 2008 is listed in previous year reports.

Table 19. Length frequency, CPUE (fish/1000M ${ }^{3}$ ), median catch, and geometric mean catch (standard error given in parentheses) of each 0.5 mm class of crappie collected during nocturnal neustonic tow net sampling ( 72 tows) at 6 sample sites in the Jonathan Creek embayment of Kentucky Lake from 30
March-16 June 2018. See Appendix A for sample site locations.

| Date | Location | mm class |  |  |  |  |  |  |  |  |  |  |  |  |  | CPUE | *Median *Geometric Mean |  |

* represents temperature readings taken during the larval sampling events

Table 21. Estimated crappie hatch dates in Jonathan Creek, derived using larval fish lengths back calculated using a growth rate derived from the daily ring counts of juveniles in 2018. Hatch dates from Jonathan Creek and Blood River derived solely from daily ring counts of juveniles also provided. "\# hatch" represents the time when crappie actually hatched on the nest. "\#spawned" represents the estimated time when crappie eggs were fertilized. Elevation (mean feet above sea level) and mean daily discharge (cubic feet/second) at Kentucky Dam also provided. Temperature readings (1 meter below surface) taken at Hancock Biological Station in main channel. Environmental variables were provided by TVA and Murray State University.

| Jonathan Creek |  |  |  |  | Blood River |  | Environmental variables |  |  |

Table 22. Estimated hatch dates of black and white crappie in Jonathan Creek and Blood River, derived using daily ring counts of juveniles in 2018. "\# hatch" represents the time when crappie actually hatched on the nest. Elevation (mean feet above sea level) and mean daily discharge (cubic feet/second) at Kentucky Dam also provided. Temperature readings (1 meter below surface) taken at Hancock Biological Station in main channel. Environmental variables were provided by TVA and Murray State University.

*Mean length calculated using a w eighted average applied to the whole fall trapnet sample
A Indicates year where age and grow th data was not collected. Age and grow th data from the previous year w as used to calculate the appropriate value.
Data from 1985 to 2008 is listed in previous annual reports.
Revised_Barkley_Crappie_Database

Table 37. Proportional stock density (PSD) and relative stock density ( $\mathrm{RSD}_{10}$ ) of white and black crappie collected by trap-nets (119 net-nights) at Lake Barkley from 23 October-9 November 2018. Sub-Total uses only data collected from Little River and Donaldson Creek. Numbers in parentheses represent 95\% confidence intervals.

| Location | Species | N | PSD | $\mathrm{RSD}_{10}$ |

Appendix B. Lake Barkley creel survey areas, 2018.

## Appendix C. LAKE Barkley ANGLER ATTITUDE SURVEY 2018.

1. Have you been surveyed this year? Yes - stop survey
2. Name $\qquad$ (Optional)
and Zip Code $\qquad$
3. How many times do you fish Lake Barkley each year?

First time here $5.6 \% \quad 1$ to $49.6 \% \quad 5-1019.7 \% \quad$ More than $1065.2 \%$
4. Which species of fish do you fish for at Lake Barkley (check all that applies)?

Redear 16.7\% Bluegill 23.4\% Black Bass 60.2\% Crappie 53.2\% Catfish 33.7\% White bass 17.0\% Yellow bass 7.5\%
Other- Asian carp 0.3\%; Striped bass, Sauger, Anything each 0.6\%
5. Which one species do you fish for most at Lake Barkley (check only one)?

Redear 1.7\% Bluegill 3.4\% Black Bass 45.0\% Crappie 29.5\% Catfish 16.1\% White bass 3.4\% Yellow
bass 0.6\% Other- Anything 0.3\%

## Answer the following questions for each species you fish for - (see question 4)

## Redear Anglers

6. In general, what level of satisfaction or dissatisfaction do you have with redear fishing at Lake Barkley? Very satisfied 13.3\% Somewhat satisfied $45.0 \% \quad$ Neutral 21.7\% Somewhat dissatisfied 11.7\%
Very dissatisfied 3.3\% No opinion 5.0\%
6a. If you responded with somewhat or very dissatisfied in question (6) - what is the single most important reason for your dissatisfaction?
Number of fish 100.0\% Size of fish 0.0\% Not happy with regulations 0.0\% Don't know how to catch them 0.0\%

## Bluegill Anglers

7. In general, what level of satisfaction or dissatisfaction do you have with the bluegill fishing at Lake Barkley? Very satisfied 41.9\% Somewhat satisfied 31.4\% Neutral 7.0\% Somewhat dissatisfied 7.0\% Very dissatisfied 2.3\% No opinion 10.5\%

7a. If you responded with somewhat or very dissatisfied in question (7) - what is the single most important reason for your dissatisfaction?
Number of fish $85.7 \%$ Size of fish $14.3 \%$ Not happy with regulations $0.0 \%$

## Black Bass Anglers

8. In general, what level of satisfaction or dissatisfaction do you have with the black bass fishing at Lake Barkley? Very satisfied 15.7\% Somewhat satisfied 32.7\% Neutral 14.3\% Somewhat dissatisfied 19.8\% Very dissatisfied 10.6\% No opinion 6.9\%

8a. If you responded with somewhat or very dissatisfied in question (8) - what is the single most important reason for your dissatisfaction?
Number of fish $88.3 \%$ Size of fish $1.7 \%$ Not happy with regulations $0.0 \%$ Other- Too many tournaments, No grass, Water level too low each 1.7\%; Asian carp 5.0\%

## Crappie Anglers

9. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Lake Barkley? Very satisfied 17.7\% Somewhat satisfied 35.9\% Neutral 14.6\% Somewhat dissatisfied 15.6\% Very dissatisfied 4.7\% No opinion 11.5\%

9a. If you responded with somewhat or very dissatisfied in question (9) - what is the single most important reason for your dissatisfaction?
Number of fish $97.1 \% \quad$ Size of fish 0.0\% Not happy with regulations 0.0\% Other- Poor weather 2.9\%

## Catfish Anglers

10. In general, what level of satisfaction or dissatisfaction do you have with the catfish fishing at Lake Barkley? Very satisfied 73.8\% Somewhat satisfied 18.0\% Neutral 2.5\% Somewhat dissatisfied 0.8\% Very dissatisfied $0.0 \% \quad$ No opinion 4.9\%

10a. If you responded with somewhat or very dissatisfied in question (10) - what is the single most important reason for your dissatisfaction?
Number of fish $100.0 \%$ Size of fish $0.0 \%$ Not happy with regulations $0.0 \%$ Too much commercial fishing $0.0 \%$

## White Bass Anglers

11. In general, what level of satisfaction or dissatisfaction do you have with the white bass fishing at Lake Barkley? Very satisfied $61.3 \% \quad$ Somewhat satisfied $25.8 \% \quad$ Neutral $3.2 \% \quad$ Somewhat dissatisfied $6.5 \%$ dissatisfied $0.0 \% \quad$ No opinion $3.2 \%$

11a. If you responded with somewhat or very dissatisfied in question (11) - what is the single most important reason for your dissatisfaction?
Number of fish $75.0 \%$ Size of fish $0.0 \%$ Not happy with regulations $0.0 \%$ Other- Asian
carp 25.0\%

## All Anglers

12. Are you satisfied with the current size and creel limits on all sport fish at Lake Barkley? Yes 94.4\% No 5.6\% 12 a . If you responded "No" to Question 11, which species are you dissatisfied with and what size and creel limits would you prefer? Creel Limit (CL), Length Limit (LL), Slot Limit (SL)

Crappie-15 CL, 11" LL, 12" LL, 12-15" SL
Bass - Largemouth 12" LL, Smallmouth 12" LL, Spotted 15" LL
Catch photo release bass tournaments only, limit bass tournament anglers to 3 fish, ban all bass tournaments
13. Are you aware that the Kentucky Department of Fish and Wildlife creates and maintains shallow water stakebeds marked with white poles, and deepwater brushpiles marked with white buoys as fish attractors in Lake Barkley? Yes 81.0\% No 19.0\%

13a. When you fish Lake Barkley, how regularly do you fish around Department placed fish attractors? Always 0.7\% Frequently 16.1\% Occasionally 37.8\% Rarely 23.4\% Never 22.0\%

13b. If you answered "Rarely" or "Never", what is the single most important reason you don't fish around Department placed fish attractors?
Over fished 2.4\% No boat 7.1\% No success 7.1\% Don't know their location 33.3\% Wrong water depth 9.5\% Fishes own stuff $24.6 \%$ Boat too big $0.0 \%$ Get snagged $0.8 \%$ Other- only while crappie fishing, only in fall and spring, only in spring, only fishes the channel, doesn't fish for crappie, no experience with attractors, only fishes ledges each $0.8 \%$; wrong species, $1^{\text {st }}$ time at Lake Barkley each $1.6 \%$; only fishes docks $2.4 \%$; only catfishes $4.0 \%$
14. If you fish for crappie, do you spider rig (three or more poles per angler at the same time) as your primary method of crappie fishing?
Yes 13.9\% No 41.8\% Don't Fish 44.3\%
$\begin{array}{lllllllllllllll}\text { 14a. If "Yes", how many poles do you use? } 3 \text { 26.1\% } & 4 & 52.2 \% & 5 & 2.2 \% & 6 & 8.7 \% & >6 & 10.9 \%\end{array}$
15. Do you support or oppose a pole limit while fishing for crappie? Support 23.1\% Oppose 14.1\% No Opinion 62.8\%

15a. If you support a pole limit, what should be the pole limit per person?
$18.8 \% \quad 233.8 \% \quad 340.0 \% \quad 4 \quad 15.0 \% \quad 5 \quad 2.5 \% \quad 6 \quad 0.0 \% \quad>6 \quad 0.0 \%$
16. If you fish for catfish, do you fish with multiple poles at the same time? Yes 15.1\% No 20.1\% Don't Fish 64.8\%

16a. If "Yes", how many poles do you use? $2 \quad 69.2 \% \quad 3 \quad 19.2 \% \quad 4 \quad 11.5 \% \quad 5 \quad 0.0 \% \quad 6 \quad 0.0 \% \quad>6 \quad 0.0 \%$
17. Do you support or oppose a pole limit while fishing for catfish? Support 13.5\% Oppose 24.6\% No Opinion 61.9\%

17a. If you support a pole limit, what should be the pole limit per person?
$123.5 \% \quad 223.5 \% \quad 329.4 \% \quad 423.5 \% \quad 50.0 \% \quad 6 \quad 0.0 \% \quad>6 \quad 0.0 \%$
18. If you fish for catfish in Lake Barkley, which is more important to you: catching trophy fish, or catching more keeper size fish to eat?

Trophy fish 10.6\% Catching keeper fish to eat 61.0\% Both equally important 27.6\% No opinion 0.8\%
19. If you fish for bluegill, what do you consider to be a keeper size (inches) fish?
$618.4 \% \quad 75.3 \% \quad 8 \quad 3.9 \% \quad 9 \quad 0.3 \% \quad 10 \quad 0.0 \%$ don't fish $71.0 \%$ Other-3 0.3\%; $50.8 \%$
19a. Which do you consider to be more important: Catching more keeper size bluegill, or more trophy size ( $>10 \mathrm{in}$ ) bluegill?
More keepers 95.2\% More trophy size $3.8 \%$ No Opinion 1.0\%
20. If you fish for redear sunfish, what do you consider to be a keeper size (inches) fish? $6 \quad 7.2 \% \quad 7 \quad 1.9 \% \quad 8 \quad 12.3 \% \quad 9 \quad 1.7 \% \quad 10 \quad 3.3 \%$ don't fish $72.4 \%$ Other- $30.3 \% ; 50.6 \% ; 120.3 \%$

20a. Which do you consider to be more important: Catching more keeper size redear, or more trophy size (>10in) redear? More keepers $84.4 \% \quad$ More trophy size $15.6 \% \quad$ No Opinion $0.0 \%$
21. Currently, sunfish ( bluegill, longear, and redear <6 inches) are allowed to be used as bait. How often do you use sunfish as bait?
Always $0.3 \% \quad$ Frequently $0.6 \% \quad$ Occasionally $3.3 \% \quad$ Rarely $7.0 \% \quad$ Never 88.9\%
22. Are you aware that Asian carps are generally considered to be an excellent fish to eat? Yes 66.3\% No 33.7\%

## Appendix D. Comments from Lake Pennyrile Voluntary Creel Survey Cards.

- Wish it would be easier to use/load my own boat wihth electric trolling motor. In the past, have accessed the back of the lake in my own canoe and had good fishing
- Been coming to Pennyrile for 20-22 years- seems like the bluegill was a bit slower this year and the bass had picked up
- 15 people fishing
- Fantastic bluegill fishing-I have fished here for the last 3 years in June. Quit and relaxing fishing. Keep it like this!!!
- 2-3 years- no catfish whatsoever. Seemed like bluegill and redear were a little slow. Love coming here to fish. Estimate 325 miles from Letcher County. A hidden gem in my opinion
- Please build a dock just for fishing
- All were returned
- Need ramp to bring own small boat or kayak
- Make more spots available from the banks
- More bank access around lake along trail
- We fish in here, a big joke
- My son played around with a net and got 2 mud turtles
- Stock the lake, used to catch fish here
- A God @*!\# waste of time and money
- Came back today, not as good as yesterday
- I come frequently and love it. The staff is very friendly
- Very peaceful and quiet
- Very difficult to locate fish!
- Sucked
- Whatever you did the other year to the water killed all the fish. When you turned the water blue you killed the fishing. I used to catch a lot of fish. Not a thing now.
- It was great!!
- The fishing was fruitless
- There is no fish at all!!!
- Need to clear out places to fish from shore/ very grown up (vegetation)
- Nothing Terrible

# NORTHWESTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Table 1 presents a summary of conditions encountered while sampling at state-owned or managed lakes and ACOE reservoirs during the 2018 field season.

## Nolin River Lake

## Crappie Sampling

Nolin River Lake was sampled for crappie November 5-6 (Tables 2-6). Trap nets were set on the $5^{\text {th }}$, but heavy rain that night caused the lake to rise several feet and the nets had to be pulled on the $6^{\text {th }}$. The lake remained high for several weeks and nets could not be re-set. Sampling data are being included, but no inferences as to population structure or catch rate should be made. Weights and otoliths were collected from a sample of each inch class. Length at age data indicate excellent growth, which has been the case for the last several years.

## Rough River Lake

## Black bass Sampling

Spring sampling for largemouth bass could not be conducted in 2018 due to high water levels throughout the sampling period; therefore, population structure and catch rate data could not be collected. Rough River Lake was sampled in October to collect age-growth and length-weight data (Tables 7-10). Both the length at age data and condition data are good and very similar to those data collected in previous years.

## Crappie Sampling

Trap netting to sample Rough River Lake's crappie population was conducted the last week of October (Tables 1115). A total of 507 crappie ( 417 white crappie) were collected during 71 net-nights for a total CPUE of 7.1 fish/nn. Weights were taken and otoliths removed from a representative sample of each inch class. The CPUE's observed were much lower than anything previously recorded. The low catch rates are most likely due to the unseasonably warm temperature and stable weather pattern encountered during the week of sampling. The length and age distribution of the population is satisfactory and similar to past observations. Growth rate is similar to that collected over the last few years, but is still lower than growth rates observed from 2002-2009. Growth rates began declining in 2011 as the result of several overly abundant year classes back to back. Length at age continues to remain rangy with age groups showing significant overlap of inch classes.

## Hybrid Striped Bass Sampling

Gill netting to monitor the hybrid striped bass population was conducted during last week of October (Tables 1620). The Northwestern Fishery District ran nets on the South Fork and the Urban Fisheries Research Section ran nets on the North Fork. Catch rates in 2018 were slightly higher than the last couple of years, but in-line with previous collections. The catch rate of age-1 fish was significantly greater than it has been in many years. Growth rate is excellent as it has been for the last couple of years. Growth was fairly consistent from 1999 to 2014 and then began increasing in 2016. The age composition of the hybrid population in 2018 was unlike what is typically found. In 2018, age-0 (31.7\%) and age-1 (59.8\%) fish accounted for $91.5 \%$ of the population. In previous surveys, a higher percentage of age- 2 to age- 5 fish have been present in the population. Gill netting will continue in 2019 as part of a project to detect differences in survival and growth rate of reciprocal and original crosses. The hybrid striped bass population continues to be relatively stable and thriving. Mortality estimates for 2018 were the highest of record. This is supported by sampling data that indicated a lower frequency of larger/older fish. In addition, a creel survey was conducted at Rough River Lake in 2018 with which to cross-reference. The creel survey indicated a substantial increase in hybrids caught and harvested in 2018 compared to previous surveys, which mirrors the sampling data
and mortality estimates. Another creel survey and continued net sampling will be conducted in 2019 to see if this trend continues.

In response to frequent angler complaints about not being able to find or catch fish during the summer months, a radio telemetry project was initiated in 2018 to determine summer locations and patterns. Hybrid striped bass were collected via electrofishing from the upper lake/river area (Eveleigh to Adkins Camp boat ramps). Thirty-nine hybrid striped bass from 15.8-22.3 in were surgically implanted with VEMCO V13T transmitters ( $13 \mathrm{x} 43 \mathrm{~mm}, 12.0 \mathrm{~g}$ air). Twelve VEMCO VR2W receivers were deployed throughout the lake on May 11, 2018. Receivers will remain in place through 2020. All data will be compiled, analyzed and reported in 2020.

## Channel Catfish Sampling

Gill netting to assess the channel catfish population was conducted concurrently with hybrid striped bass sampling. A total of 74 channel catfish were collected over 10 net-nights for a CPUE of 7.4 fish per net-night (Tables 21-22). The catch rate and length distribution documented in 2018 is similar to previous collections. Weights were recorded for each catfish sampled and indicate condition (Wr) is good and similar to previous collections.

## Dissolved Oxygen - Temperature Profiles

Dissolved oxygen and temperature profiles were conducted in June, July, August, and October in 2018 (Tables 2326) to document seasonal changes in water temperature and dissolved oxygen levels throughout the water column. Profiles were conducted at five sites (upper, middle, and lower South Fork and middle and lower North Fork) along the main channel of the lake. Profiles have been conducted since 2013 as part of two ongoing projects. One documenting survival and growth of stocked original and reciprocal hybrid striped bass, and the other monitoring seasonal movement and habitat use with radio telemetry equipment. D.O./temp profiles collections will continue through 2020.

## Creel Survey

A random, stratified, roving, creel survey was scheduled for 16 days per month at Rough River Lake from April 01 to October 31, 2018 to estimate angling pressure and angler catch/harvest statistics (Tables 27-33). The survey did not begin until April $11^{\text {th }}$ due to lake conditions. Creel interviews and angler attitude surveys were collected using an iPad for the first time in 2018.

For survey purposes, the lake is divided into North Fork and South Fork sections with one section being surveyed per day (6-hour time period) during either a morning or afternoon time period. Each section (North and South forks) was further divided into three equal subsections that were randomly and progressively counted and interviewed spending an equal amount of time (2-hours) in each.

As has been the case in previous creel surveys conducted at Rough River Lake (1993, 1997, 1999, 2005, and 2010), the estimated angling effort declined from the preceding survey ( 22.95 man-hours/acre in 2018 vs. 24.50 manhours/acre in 2010). This decline has been minimal in the 2000's ( $<5$ man-hours/acre) but was more precipitous in the 1990's. Despite the decline in angler effort, estimates for the total number of fish caught $(371,981)$ and harvested $(133,895)$ in 2018 were increases from $210(213,787$ fish caught and 68,683 harvested).

Black bass were the most sought after species in 2018, as they have been in every survey, with 11.52 man-hours per acre expended toward them. Black bass are followed by crappie with 5.57 man-hours per acre, hybrid striped bass at 1.4 man-hours per acre, and panfish and catfish very similar at 0.93 and 0.89 man-hours per acre, respectively. Those anglers indicating they were fishing for "Anything" expended 2.63 man-hours per acre. In 2018, an estimated 20.85 largemouth bass per acre were caught and 1.74 largemouth bass per acre were harvested averaging 15.1 in . The estimated 20.85 fish/acre caught is the highest ever recorded and is almost double the second highest value of 11.10 fish/acre in 1997. The 1.74 fish harvested/acre and average length of 15.1 in are also the highest values recorded for those statistics but are similar to prior estimates.

The estimated 5.57 hours per acre expended by crappie anglers in 2018 is the lowest amount of angling pressure for crappie recorded in any previous survey. Despite angling pressure in 2018 being the lowest recorded, the 30.37
white crappie caught per acre, the 16.70 white crappie harvested per acre, and the 2.99 white crappie harvested per hour are the highest values recorded to date for those parameters. The mean length of harvested white crappie in 2018 was similar to previous observations.

Overall, with the exception of black bass, angling pressure was lower in 2018. At the same time, the numbers of fish caught and harvested increased in 2018, indicating an increased rate of success for anglers.

The 1.40 angler-hours per acre estimated in 2018 for hybrid striped bass is similar to what has been estimated in past surveys, however, the 4.28 hybrid striped bass caught, 1.52 hybrid striped bass harvested per acre, and 0.91 hybrid striped bass harvested per hour greatly exceed these parameter values recorded in previous surveys. The mean length ( 16.7 in ) of harvested hybrid striped bass is similar to previous surveys.

An angler attitude (AA) survey was conducted during the creel survey to determine angler preferences, satisfaction, and general knowledge of KDFWR projects (Figure 1). The number of angler attitude surveys completed in 2018 $(\mathrm{N}=793)$ is nearly four times greater than collected during the previous creel survey in 2010. Each respondent was asked for their home zip code. Ninety percent of respondents were Kentucky residents with the remaining ten percent originating from up to 13 different states. There is likely an overrepresentation of non-residents caused by data entry error (zip code). In general, species preference and satisfaction results are similar to the AA survey from 2010. Bass and crappie are, by far, the primary species most frequently targeted ( $80.9 \%$ ). The vast majority of anglers ( $97.8 \%$ of bass anglers and $99.8 \%$ of crappie anglers) were "Satisfied" with the fishery (very or somewhat satisfied). Only 23 anglers indicated that they fish primarily for hybrid striped bass ( $2.9 \%$ ), while 144 ( $18.2 \%$ ) respondents indicated that they do fish for hybrids. Ninety-five percent of hybrid anglers were "Satisfied" with the fishery. The vast majority of respondents fish at Rough River Lake more than 10 times per year ( $73.6 \%$ ), while another $22.7 \%$ fish at Rough River Lake between five and ten times annually. These two groups encompass $96.3 \%$ of respondents, which is a $20 \%$ increase from the 2010 survey. Questions 11-15 relate to habitat improvement efforts and were asked for the first time at Rough River Lake in 2018. The majority of respondents indicated they were aware that we (KDFWR) place fish habitat structures within the lake ( $69.9 \%, \mathrm{~N}=554$ ), and $94.8 \%(\mathrm{~N}=525)$ indicated that they have fished around the structures previously. The majority of respondents discovered the structures while the lake was at winter pool ( $67.0 \%$ ), while $16.6 \%$ learned about the structures from the KDFWR website. Furthermore, $75.1 \%$ of respondents indicated they were aware that the locations of KDFWR-placed structures are available on our website. Finally, $76.2 \%$ of respondents feel that the addition of these structures has improved their fishing success. The summation of the habitat structure questions affirms the emphasis we have placed on habitat improvement in recent years and provides the evidence desired to continue such efforts.

Figure 1. Results of Rough River Lake angler attitude survey conducted April 01-October 31, 2018.
ROUGH RIVER LAKE ANGLER ATTITUDE SURVEY 2018 ( $\mathrm{N}=793$ )

Have you been surveyed this year? Yes - stop survey No - continue

1. Home Zip Code 114 unique zip codes

14. Do you feel the addition of KDFWR placed attractors/structures has improved your fishing success? $(\mathrm{N}=554) \quad$ Yes 76.2\% No 23.8\%
15. Are you aware the locations of all KDFWR placed attractors/structures are available on our website? $(\mathbf{N}=554) \quad$ Yes $75.1 \%$ No 24.9\%

## Lake Malone

## Largemouth Bass Sampling

Electrofishing to assess the largemouth bass population at Lake Malone was conducted during April (Tables 34-37). With the exception of fish < 8.0 in , catch rates for the remaining length groups increased from 2017 to 2018. The three most abundant inch classes were those currently protected by the slot limit ( $12.0-14.9 \mathrm{in}$ ). Catch rate for fish $\geq 15.0$ in was among the highest recorded, while catch rate for fish $\geq 20.0$ in was the highest documented to date. Total CPUE is similar to previous collections. While Lake Malone has historically been plagued by an overabundance of bass < 12.0 in, catch rates for fish < 12.0 in declined somewhat in 2017 and 2018. CPUE of age-1 fish has historically been mediocre at Lake Malone, however catch rates for the length groups used for assessment do not appear to be negatively affected, and it is possible we are not effectively sampling these smaller fish. Based on sampling data, the largemouth bass population at Lake Malone is in Good- to- Excellent condition based on statewide assessment values. Age-growth data will be collected in 2019 or 2020.

## Mauzy Lake

## Largemouth Bass Sampling

Electrofishing to assess the largemouth bass population at Mauzy was conducted in April (Tables 36, 38-42). The catch rate of largemouth bass less than 12.0 in remains high and in line with the past several years. There was a slight uptick in catch rate of larger fish ( $\geq 15.0$ and $\geq 20.0 \mathrm{in}$ ) in 2018 but overall the fishery is dominated by 8.0 - to 12.0 -in fish. Mauzy was sampled again in October to collect fish for age and growth analysis. The catch was anemic due to very clear water and excessive Eurasian watermilfoil. Fifty-six fish were collected and used for age-growth determination. Mean length at age data has decreased once again and is the lowest recorded since 2001. The back calculated lengths at age-1 show a decline since 2013. The lake has not had consecutive years of stable pool elevation in the past decade. The lake was again drawn down during the winter of 2018-2019 in an attempt to control vegetation. However, consistent rains prevented the lake from remaining down at a stable elevation for much of the winter and it is yet to be determined if the drawdown will be successful in reducing the vegetation. Lake fertilization efforts were discontinued in 2008 and could be contributing to increases in water clarity, aquatic vegetation growth, and a decline in fish growth. A fertilization program will be re-initiated in 2019 in hopes of offsetting these negative effects.

## Bluegill Redear Sunfish Sampling

Electrofishing to assess the bluegill and redear sunfish populations was conducted in May (Tables 43-49). In 2018, bluegill catch rate was the lowest documented since 2000. Catch rates in 2018 declined for bluegill < 3.0 and 3.0-5.9 in, but nearly doubled for 6.0- to 7.9-in fish compared with 2017. Bluegill were collected in October for age-growth analysis. Back-calculated mean length at age-2 (3.1 in) was the lowest documented since 2001. Years to reach 6.0 in is still greater than 5 years as it was in 2015 when fish were last aged.

Beginning in 2014, catch rates for redear sunfish topped those of bluegill. Redear sunfish CPUE in 2018 was down slightly from the two previous years but still within the expected range. Catch rates for redear sunfish 3.0-5.9 in and 6.0-7.9 in decreased in 2018 while the catch rate for fish $\geq 8.0$ in increased once again. We have yet to see a redear top the 9.0 -in mark, which is surprising given the prolific submersed aquatic vegetation present the past few years. Redear were collected in October in conjunction with bluegill and largemouth bass for age-growth analyses. Back calculated mean length at age-3 ( 6.2 in ) and years to 8.0 in $(\geq 6)$ continues to be poor. Back-calculated lengths at age suggest growth may be improving slightly but not to the desired ranges. Lake fertilization efforts will hopefully increase redear growth as well.

Ultimately, Mauzy Lake would benefit from another, more complete, renovation. Plans to dredge and deepen extensive shallow areas, upgrade existing bank fishing access, install fish habitat, lime the lake basin, renovate the fishery, and construct a headwater wetland will be created in 2019 and will then be in place to move forward when possible. Mauzy Lake is wholly contained within a WMA and renovation efforts could easily be accomplished.

## Carpenter Lake

## Largemouth Bass

Largemouth bass were sampled at Carpenter Lake in April 2018 (Tables 36, 50-54). Total CPUE was within the range of previous samples. Catch rate for fish 12.0-14.9 in is the highest recorded (CPUE 108.0 fish $/ \mathrm{hr}$ ), surpassing 2017's catch rate of $100.0 \mathrm{fish} / \mathrm{hr}$. Catch rate for fish $\geq 15.0 \mathrm{in}(49.3 \mathrm{fish} / \mathrm{hr})$ was the highest recorded since a nocturnal sample in 2001 ( $66.7 \mathrm{fish} / \mathrm{hr}$ ). The catch rate for bass 8.0-11.9 in was the lowest on record ( $17.3 \mathrm{fish} / \mathrm{hr}$ ) and will need to be followed in upcoming years to determine if it was simply a sampling anomaly, or if the fish are not present in the population. Bass were collected again in October for age-growth analysis. Mean length age- 3 at capture was 11.3 in and the best documented since the 2003 age-growth analysis. The bass population at Carpenter is relatively stable and performing as expected.

Saugeye will be stocked in 2019 in an attempt to reduce the gizzard shad and crappie spp. populations.

## Bluegill/Redear Sunfish Sampling

Electrofishing to assess the bluegill and redear sunfish populations was conducted in May (Tables 45, 53, 55-58). Total catch rate for bluegill is within the range of collections over the past eight years. Beginning in 2011, the total catch rate for bluegill increased substantially and has mostly lingered within this "new" range since. Catch rate for 3.0- to 5.9 -in bluegill was the highest on record ( 528.0 fish/hr.), while the catch rate for bluegill 6.0-7.9 in was the third lowest on record ( $8.1 \mathrm{fish} / \mathrm{hr}$.). Bluegill were collected for age-growth determination in October. Backcalculated mean length age-2 decreased slightly from 2015, but remains high. Back-calculated length at age data suggests growth may be declining for fish ages 2 and 3. Bluegill greater than 8.0 in have not been collected in Carpenter Lake since 2007. Gizzard shad were first discovered in the lake in 2006 and are most likely negatively affecting the bluegill population. After two failed shad eradication efforts, saugeye will be stocked at 70 fish/acre beginning in 2019 in an attempt to reduce the gizzard shad and small crappie populations and increase bass predation on the bluegill. Increased predation on the bluegill should positively affect bluegill growth and produce bluegill greater than 8.0 inches in the future.

Forty redear sunfish were collected in May in conjunction with bluegill sampling. Total catch rate and catch rates for standard length groups are all within expected ranges. Redear sunfish less than 3.0 in have not been collected since 2010. That is likely a result of sampling inefficiencies rather than lack of reproduction as evidenced by the CPUE of 3.0- to 5.9-in fish observed this year. Numbers remain fairly low but quality-fish are available. Only three redear sunfish were collected in October, therefore age-growth analyses were postponed.

## New Kingfisher Lakes

## Largemouth Bass

Electrofishing to assess the largemouth bass population at New Kingfisher Lake was conducted in April and October (Tables 36, 59-62). A total of 59 largemouth bass were collected in 0.375 hours of spring sampling, but only 16 fish were collected in the fall. Largemouth bass recruitment seems to be limited, possibly due to egg and fry predation by the overabundant sunfish population. Stocking of advanced largemouth bass fingerlings is planned for fall 2019, pending spring sampling results. Catch rate for fish greater than 15.0 and 20.0 in is the highest collected in New Kingfisher Lake. The largemouth bass fishery should continue to grow over the next few years as multiple year classes develop and stabilize.

## Bluegill Redear Sunfish Sampling

The sunfish population was sampled via electrofishing in May (Tables 45, 63-65). Total bluegill CPUE was the highest collected since 1999 with bluegill 3.0-5.9 in accounting for $90 \%$ of the total. The first bluegill greater than 8.0 in (at least for the last 30 years) was sampled in New Kingfisher in 2018. Growth is likely slower than ideal due to sheer number of sunfish in the lake. Total sunfish CPUE does not take into account the presence of green sunfish
and warmouth. A shoreline rotenone treatment will be conducted during summer 2019 to reduce undesirable sunfish as well as knock back some of the overabundant bluegill/redear sunfish. Until the largemouth bass population grows and stabilizes, sunfish growth and size structure will suffer. Age-growth data will be collected in a few years after populations have stabilized.
Gizzard shad were documented in both spring and fall samples. The bluegill population will be monitored to ensure adequate growth and size structure develops. If not, shad control methods (winter rotenone treatments and/or saugeye stocking if it proves successful in Carpenter Lake) will be invoked.

## Old Kingfisher Lake

## Largemouth Bass

Electrofishing to assess the largemouth bass population was conducted at Old Kingfisher Lake in April and October (Tables 36, 66-69). A total of 35 bass were collected in April ranging from 5.0 to 20.0 in . Total CPUE declined from 2017 to 2018. There are noticeable gaps in the length distribution. Growth does not appear to be fast enough that fish are skipping inch classes, but too few fish were collected in October for growth analysis. The large group of less than 8.0 -in fish documented in 2017 is not visible within the 2018 sampling data. This population will continue to be tracked spring and fall to dictate future management steps. Depending on spring electrofishing results, advanced fingerling largemouth bass may be stocked in fall 2019.

## Bluegill Redear Sunfish Sampling

The sunfish population at Old Kingfisher Lake was sampled via electrofishing in May (Tables 45, 70-72). Total bluegill CPUE was 1149.7 fish $/ \mathrm{hr}$, which is similar to the 2017 total CPUE ( 1333.3 fish $/ \mathrm{hr}$ ). Catch rate for each length group declined. The majority ( $78 \%$ ) of fish collected were 4.0 to 5.0 in . A shoreline rotenone treatment will be attempted summer 2019 to reduce undesirable sunfish as well as knock back some of the overabundant bluegill/redear sunfish. Until the largemouth bass population grows and stabilizes, sunfish growth and size structure will suffer. Age-growth data will be collected after populations have stabilized. Gizzard shad were documented during 2018 at Old Kingfisher Lake and will be monitored along with the sunfish to determine if shad control strategies need to be employed. Two potential options for controlling the shad are winter shad eradications and saugeye stocking.

Old and New Kingfisher are now connected by a six-foot metal culvert and should presumably develop nearly identical fish populations. If, after several years, both Old and New Kingfisher show similar population characteristics, sampling data may be combined and reported together as Kingfisher Lake.
*Old and New Kingfisher were drawn down December 2012 to complete renovation work. The lakes were allowed to dry during 2013 and renovation work was completed during the summer of 2014. As water levels increased, channel catfish, bluegill and advanced fingerling largemouth bass were stocked in fall of 2015.

## Washburn Lake

## Largemouth Bass

Electrofishing to assess the largemouth bass population at Washburn Lake was conducted in April and October (Tables 36, 73-76). The population has been relatively stable over the past several years and comprised mostly of fish less than 12.0 in with one or two larger fish collected. Catch rate for bass less than 12.0 in declined in 2018 but it appears those fish have moved into the 12.0 - to $14.9-\mathrm{in}$ and $\geq 15.0-\mathrm{in}$ length groups. Catch rates for those two groups are among the highest recorded. Total CPUE fell within the expected range. Age-growth data collected in 2017 show back-calculated mean length at age continues to decline from a high of 13.1 inches in 2007. The fertility issue has yet to be resolved and water clarity can range from 8 -foot + to $<18$ in within a week's time. Submerged aquatic vegetation has also become an issue that requires chemical treatment multiple times a year. There are likely several factors contributing to the poor quality of this fishery. A different formulation of fertilizer (powder, 10-52-4) will be used in 2019 and will hopefully have the desired effect, improve fish growth, and limit nuisance aquatic vegetation growth. Fifty-four grass carp were also stocked in 2019 to help with aquatic vegetation control.

## Bluegill Redear Sunfish Sampling

The sunfish population was sampled via electrofishing in May (Tables 45, 77-83). Approximately equal numbers of bluegill and redear sunfish were collected again in 2018. Total bluegill catch rate is the highest recorded since renovation (2001). Catch rate for 3.0- to 5.9-in bluegill increased substantially and is the highest on record. Catch rates for other length groups are within the normal range for Washburn. Bluegill were collected in October for agegrowth determination. Back-calculated mean length at age-2 ( 3.5 in ) has been declining since 2003 and continued in 2018. It appears fish are growing slowly for their first two to three years and then growth rate is increasing to expected rates. This needs to be confirmed with a subsequent age sample if adequate 6.0 - to 8.0 -in fish can be collected. CPUE of fish greater than 6.0 in is very good but their ages are uncertain.

Redear sunfish have been on a general rise since 2012. Sampling conducted in May revealed the highest total catch rate for redear sunfish to date. There were substantial increases in catch rate for 6.0 - to 7.9 -in and $\geq 8.0$-in length groups. Thirty-six redear were collected in October for age-growth analysis. All growth parameters are excellent for redear sunfish at Washburn Lake, in addition to CPUE of fish $\geq 8.0 \mathrm{in}$. While there has yet to be a $10.0+$ in fish collected, data indicate those fish could be seen in 2019 and subsequent years. A reduction in submerged aquatic vegetation may impact redear growth and will be monitored in successive years.

Despite a decent sunfish fishery, Washburn Lake needs another renovation. Plans to dredge and deepen extensive shallow areas, create more bank fishing access, install fish habitat, lime the lake, renovate the fishery, and replace the existing water control structure will be created in 2019. The current water control tower leaks profusely and could fail at any time, requiring plans to be in place to move forward with a renovation when necessary.

Table 1. Annual summary of sampling conditions by waterbody, species sampled and date for Northwestern Fishery District lakes during 2018

| Water body | Species | Date | $\begin{aligned} & \text { Time } \\ & \text { (24hr) } \end{aligned}$ | Gear | Weather | Water temp. F | Water level | Secchi <br> (in) | Conditions | Pertinent sampling comments |

# SOUTHWESTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Lake sampling conditions are summarized in Table 1.

## Barren River Lake (10,000 acres)

## Black Bass

Spring black bass were not sampled due to high water levels (8-10 ft. above summer pool)
Fall young of year sampling (Tables 2 and 3) suggested a very good 2018 year-class. Largemouth bass made up the majority of the fall sample ( $93 \%$ ), while spotted bass only made up $6 \%$ of the sample (Table 2). Smallmouth bass remain poorly represented in samples. Age-0 CPUE ( $215.2 \mathrm{fish} / \mathrm{hr}$; Table 3) and age-0 CPUE $\geq 5.0 \mathrm{in}$ ( $48.8 \mathrm{fish} / \mathrm{hr}$ ) was higher than the average from the past 15 years. Age-0 largemouth bass mean length ( 3.9 in ) was average compared to most years.

## Marion County Lake (25 acres)

## Sunfish

Diurnal electrofishing results for bluegill and redear sunfish are presented in Tables 4-9. The overall catch rate for bluegill ( $101.7 \mathrm{fish} / \mathrm{hr}$ ) was the lowest it has ever been since 2002 , while the catch rate for redear ( $56.0 \mathrm{fish} / \mathrm{hr}$ ) was also low relative to previous years (Tables 4-6). The size structure of both populations was very good (bluegill PSD $=44$, redear PSD $=61$ ) when compared to previous years (Table 7). The catch rate of $\geq 6.0$-in bluegill ( $36.6 \mathrm{fish} / \mathrm{hr}$ ) was one of the third lowest since 2005 and the catch rate of $\geq 8.0$-in bluegill ( $6.9 \mathrm{fish} / \mathrm{hr}$ ) was slightly above average; these factors resulted in a "Good" rating in the population assessment (Table 8). The catch rate of $\geq 8.0$-in redear ( $26.3 \mathrm{fish} / \mathrm{hr}$ ) decreased from the previous sample in 2016 but met the management objective of $25.0 \mathrm{fish} / \mathrm{hr}$ (Table 9 ). The catch rate of $\geq 10.0$-in fish ( 10.3 fish $/ \mathrm{hr}$ ) was the highest it has been since 2005 ; these factors resulted in an "Excellent" rating in the redear population assessment (Table 9).

## West Fork Drakes (88 acres)

## Black Bass

Results of diurnal bass electrofishing in early May (Tables 10-13) seemed to indicate a lower-density largemouth population ( 114.0 fish $/ \mathrm{hr}$ ) with a decent size structure (PSD 40). Similar to previous years, the largemouth bass length frequency was truncated after 12.0-14.0 in. Lack of larger fish seems to suggest moderate harvest and/or fishing pressure. The lake is in an urban setting, located just outside of Franklin, KY and seems to have the right recipe for higher pressure and maybe harvest. The lake is a shallow river-run system with good productivity (secchi depths in 2- to 3 -foot range) and immense shallow cover or nursery areas. The largemouth bass population assessment decreased from previous years to "Fair" due to a decrease in the number larger $\geq 15.0$-in fish (Table 13).

## Sunfish

Electrofishing results for bluegill and redear from early May were the second lowest since sampling started in 2007 (Tables 14-16). This was characterized by an overall decrease in the number of larger fish ( $\geq 3.0$-in bluegill and $\geq 6.0$-in redear). This decrease in the number of larger redear influenced the size structure ( $\mathrm{PSD}=38$ ) but the population assessment rating remained "Fair" (Tables 17-19). Bluegill size structure ( $\mathrm{PSD}=14$ ) and population assessment decreased to "Fair", due to a very low catch rate of $\geq 6.0$-in fish.

## Green River Lake (8,210 Acres)

## Muskie

Muskellunge sampling remains problematic as multiple attempts (Table 1) were made with diurnal and nocturnal electrofishing with poor results. Prior to this year, sampling results seemingly did not reflect the true population status as prior creel data (angler catch rates and attitude surveys) suggested the fishery was staying true to historic trends. Creel data for 2018 (presented later) does not offer such assurances. Fyke netting for muskie will be attempted again in 2019 in order to better assess the population. Due to poor sampling results, no catch data is presented for this year. Muskie growth rates and condition data will be presented in the Fish Habitat Branch Annual Performance Report.

## Black Bass

Nocturnal bass electrofishing was conducted on the upper and lower ends of each lake arm (Green River and Robinson Creek) during late-April and early- to-mid May (Table 20). The overall largemouth CPUE of 137.2 fish $/ \mathrm{hr}$ dipped from last year's high mark due to a poor 2017 year class. The catch rate of largemouth $\geq 15.0$ in (45.8 fish $/ \mathrm{hr}$ ) remains well above average (Tables 21 and 23). Largemouth bass size structure indices were similar to previous years ( $\mathrm{PSD}=69$; RSD=37; Table 22). The population assessment for largemouth bass remained "Excellent"; similar to the last ten years (Table 23).

Spotted bass catch rate ( $43.8 \mathrm{fish} / \mathrm{hr}$ ) remained near historic levels (approximately $50.0 \mathrm{fish} / \mathrm{hr}$ ). The population continues to produce notable numbers of fish $>12.0$ inches in length (PSD $=33$; Table 22), which was rare prior to alewife introduction in 2004, when few spotted bass achieved such lengths.

Fall YOY sampling (Tables 24 and 25) suggests a very good largemouth bass year class in 2018 as age- 0 overall CPUE ( $72.2 \mathrm{fish} / \mathrm{hr}$ ) and age- $0 \mathrm{CPUE} \geq 5.0 \mathrm{in}$ ( $36.8 \mathrm{fish} / \mathrm{hr}$ ) were both well below average. Mean age- 0 largemouth bass length ( 5.2 in ) was slightly above average.

## Crappie

Trap netting for crappie was conducted during mid-November (Table 1). The white crappie population remains strongly dominated by 6.0- to 7.0 -in fish from multiple persisting year classes (Table 26 and 28). White crappie size structure index ( $\mathrm{PSD}=47$; Table 27) improved markedly from previous years. Mean age- $2+$ size ( 8.7 in ) of white crappie improved to its best mark in the last 10 years (Table 32). Age-2+ crappie lengths in years prior to the persisting population increase were typically 9.0 -in plus. The white crappie population assessment remained "Good"; similar to most years. The length-weight equation for white crappie in 2018 was similar to previous years:

$$
\log _{10}(\text { weight })=-3.84944+3.53456 \times \log (\text { length })
$$

Black crappie remain at low densities in trapnet samples ( $n=35$; Table 26), but are represented by multiple year classes ( $\mathrm{n}=6$; Table 29).

## Walleye/White bass

Experimental gill net sampling for white bass and walleye was conducted during mid-November (Table 1). White bass CPUE ( 8.8 fish/nn) continued to slide from a high in 2015 with diminished contribution from the strong 2014 year class (age-4+; Table 34). The moderate 2015 year class currently supports this fishery ( $41 \%$ of catch; Table 34) and indicates good natural reproduction resulting from lower adult densities during that time frame. Growth rates (mean length age- $2+=13.9 \mathrm{in}$; Table 36) and condition indices for all length groups ( $\mathrm{Wr}=93-94$; Table 37) of white bass remains excellent. The white bass population assessment remained "Good". The length-weight equation for white bass ( $\mathrm{n}=82$ ) was similar to previous years:

$$
\log _{10}(\text { weight })=-3.40854+3.06587 * \log _{10}(\text { Length })
$$

Walleye CPUE ( $2.1 \mathrm{fish} / \mathrm{nn}$ ) dipped slightly from 2017, but is represented by multiple year classes (Tables 33 and 35). Growth rate ( 19.5 inches by age- $2+$; Table 38) and condition indices for all length groups ( $\mathrm{Wr}=95-99$; Table 39) remain excellent. The walleye population assessment fell to "Fair" due to lower CPUE of larger fish. The length-weight equation for walleye $(\mathrm{n}=23)$ was similar to previous years:

$$
\log _{10}(\text { weight })=-3.65988+3.18484^{*} \log _{10}(\text { Length })
$$

## Green River Lake Creel (8,210 acres)

Creel survey: A roving, daytime creel survey was conducted from March 15 - November 30; results are presented in Tables 40-49. Anglers made an estimated 26,847 trips and fished for 109,033 hours with the average trip approximating 4.06 hours. Total trips dipped slightly from $2014(28,374)$, but were still much lower than 2009 $(40,095)$ and previous years. There was a notable drop in hours fished from previous years $(152,198$ in 2014; 169,561 in 2009). Trip length (4.06 hours) dipped from 2014 ( 5.36 hours); however, trip length has varied greatly over the years (ranging from 3.4 to 6 hours). Overall catch ( 2.2 fish/hour) and harvest rate ( 0.73 fish/hour) returned to more normal levels from highs noted in 2014 (Table 40). Bass narrowly returned to top billing as most soughtafter fish, accounting for $44.3 \%$ of the effort followed by crappie ( $43.3 \%$ ) and catfish (5 \%; Table 41).

Crappie angler success returned to normal levels (61\%) from a high in 2014 of $78 \%$ (Table 41). Crappie harvest rate ( 1.43 crappie/hr; Table 43) slid slightly from 2017, but remained well above the average harvest rate from the previous creel ( 0.75 crappie/hr). Crappie harvest was highest in November ( 2.43 fish/hour). Crappie angler hours $(47,188)$ dropped well below the previous creel $(80,249$ in 2014$)$, but trips $(11,619)$ were only slightly above previous years.

Bass angler trips (11,905; Table 44) were slightly higher than previous surveys (10,543 on 2009; 10,485 in 2014). Overall catch rate by bass anglers ( $0.55 \mathrm{fish} / \mathrm{hr}$ ) was similar to recent years. Bass size ranges caught by all anglers were similar to previous years (Table 41 and 48).

Catfish angler hours $(5,211)$ and trips $(1,283)$ remained similar to 2014 ( 5,543 hours and 1,033 trips $)$, but were in stark contrast to 2009 ( 15,639 hours; 3,698 trips). Differences in effort are not reflective of the fishery quality as catch ( $0.62 \mathrm{fish} / \mathrm{hr}$ ) and harvest ( 0.52 fish/hr) rates remained similar to previous years (Table 45).

Muskie angler hours plummeted to an all-time low ( 710 hours; Table 46), well below the previous two surveys ( 4,234 hours in 2014; 5,198 in 2009) and well below historic values ( 11,671 in 2003; 20,980 in 1998). Muskie anglers only accounted for $7 \%(n=21)$ of total muskies caught ( $n=292$ ). Legal-size muskie ( 36 in) catch rate was 33.8 hours/fish. Anecdotally, we have spoken to a few muskie anglers that fished the lake in 2018 and they did not notice any change in numbers or size range of muskie.

Walleye angler trips (131) and hours (529) fell off further from 2014 (422 hours; 2,265 trips) and 2009 (6,701 hours; 1,585 trips) surveys (Table 47). The 2009 creel survey marked the highest angler use of walleye since creation of the fishery in the late 1990's. Anecdotal conversation with walleye anglers that fished the lake in 2018 did not suggest a major drop off in the fishery.

Angler attitude survey: Results of the angler attitude survey are presented in Figure 1. Only 181 anglers were interviewed for attitude information, much lower than previous surveys that ranged from 508 to 987 . Angler use of Green River Lake was dominated by anglers who fish there more than 10 times annually (q. 3; 66.3\%), similar to previous years. Similar to creel data (trips and hours), anglers targeted bass most often (q. $5 ; 46.8 \%$ ) and in general (q.4; $59.7 \%$ ). Angler satisfaction with bass ( $87.6 \%$ ), catfish ( $89.3 \%$ ) and crappie ( $92.9 \%$ ) was overwhelmingly good (responses falling in the "very satisfied or somewhat satisfied" categories). Not enough anglers were interviewed to assess satisfaction with other fisheries.

Bass anglers identified "fish size" (q. 6a; 66.7\%) as the primary reason for satisfaction with the fishery. "Fish number" was also a significant reason (38.1\%) for satisfaction with the bass fishery.

Crappie angler satisfaction with the fishery was skewed toward "number of fish" (q.7a; 63\%) versus quality or size ( $27.2 \%$ ); dissimilar to the previous survey (2014) where satisfaction equally divided between "size of fish" (49.8\%)
and "number of fish" (46.8\%).
Similarly, catfish angler satisfaction with the fishery flipped from the 2014 survey to "number of fish" (q. 8a; $76.5 \%$ ) with fish size ( $23.5 \%$ ) the being next most important factor of satisfaction. Similar to the previous surveys (2009 and 2014), "hook and line" was the most common method used by catfish anglers (q. 9; 53.6\%). Only 35.7\% of catfish anglers used jugs to pursue catfish, similar to the 2014 survey. Low sample size ( $\mathrm{n}=19$ for 2018 and $\mathrm{n}=31$ in 2014) may explain low use when compared to 2009 where $81 \%$ of catfish anglers claimed to use jugs to pursue catfish. Jug fishermen fished, on average, 13 days annually with the range spanning from 5 to 40 days. No catfish anglers in this survey identified themselves as noodlers/hand grabbers. The low number of angler interviews seems the likely factor as this segment of anglers represented $19 \%$ of catfish anglers in 2014.

Few muskie anglers were contacted in angler surveys ( $n=9$, only 4 interviews for AAS), and is likely just reflective of low angler contacts overall. However, as noted in the creel data, this fishery seems to have slipped in use by anglers over the years, though satisfaction with the fishery has remained high. Other methods for monitoring this population such as angler diaries/reporting may be in order.

Anglers, overall, were very satisfied with current regulations (q. 14; 80.6\%). Anglers that did express displeasure (q. 14), desired a higher crappie size limit.

Most anglers (88.4\%; q. 15) were aware KDFWR does fish attractor work at Green River Lake and produces a map with sites depicted ( $78.5 \%$; q. 16). The majority of anglers still seemingly preferred to find fish habitat on their own (q.16a), as use of printed maps ( $38.5 \%$ ) and/or website site maps and/or coordinates (44.3\%) rated lower. Angler preferences for fish attractor material was split between "any/all" ( $42.4 \%$ ) and "natural brush" ( $47.4 \%$ ), with no anglers expressing devotion to plastics. Seemingly reflective of the lack of use of the website and printed maps, was angler lack of awareness of plastic pallet tree sites (q.18; 87.6\%). Anglers also noted difficulty locating such structures with electronics. Limited angler review (q. 18a; $n=21$ ) of plastic pallet trees was mixed, with "less hang ups/snagging" being the predominant benefit and "fewer fish" being the primary complaint.

## Metcalfe County Lake (22 acres)

## Bluegill

Information from diurnal bluegill sampling on May 1 (Table 1) is presented in Tables 49-52. Overall CPUE (710.0 fish/hr) was similar to recent surveys. Size structure index (PSD = 26) dipped below historic values (PSD = 37-47 for 2005-2016). The bluegill population assessment remained "Good", similar to previous years.

## Mill Creek Lake (109 acres)

## Sunfish

Results of diurnal sunfish electrofishing on May 1 are presented in Tables 53-56. The overall bluegill CPUE (462.9 fish/hr) was similar to previous years (Table 54). The bluegill population size structure remains dominated by intermediate-size fish ( $420.6 \mathrm{fish} / \mathrm{hr}$; PSD = 5) , similar to previous years (Tables 54-55). The population assessment remains "Poor" (Table 63), though the bass population is well balanced. The presence of a substantial gizzard shad population and lower productivity seem the likely factor hindering population improvement.

## Channel catfish

Channel catfish were sampled with tandem set hoop nets in mid-September with moderate success ( $5.1 \mathrm{fish} / \mathrm{set}-$ night; Table 57). Fish were present up to the 22.0-in inch class (Table 58). Condition ( $\mathrm{Wr}=85$ ) of channel catfish was fair for the $11.0-$ to 15.9 -in length group, and good $(\mathrm{Wr}=89$; Table 59$)$ for the 16.0 - to 23.9 -in length group. Hoopnets picked up redear size ranges that were missing or perhaps underrepresented during electrofishing sampling in May.

## Spurlington Lake (25 acres)

## Sunfish

The sunfish population was sampled by diurnal electrofishing on April 20 (Table 1 and Table 60). The catch rate of the 3.0 - to 5.9 -in bluegill length group ( $604.0 \mathrm{fish} / \mathrm{hr}$ ) returned to normalcy; however, the 6.0 - to 7.9 -in length group catch rate ( 52.0 fish $/ \mathrm{hr}$ ) was significantly lower than recent years (Table 61 ). Bluegill size structure is dominated by intermediate-size fish ( $\mathrm{PSD}=11$; Table 63), but the population assessment remained "Excellent" (Table 64), similar to previous years. A redear population assessment is not available due to the lack of fish numbers for suitable age data. Spring redear sampling was outperformed by late summer/early fall hoopnetting in 2017 (golden opportunity missed for age data collection).

## Shanty Hollow Lake (136 acres)

## Black Bass

Nocturnal bass sampling on April 26 yielded an overall largemouth bass CPUE of 249.3 fish/hr (Table 65), similar to historic data. The size structure index ( $\mathrm{PSD}=38$, Table 67 ) was similar to previous years; however, the population still suffers from persisting poor recruitment to larger length classes (15.0-in plus; Table 66). The population assessment slipped to "Good" due to a lower CPUE of 20-in plus fish (Table 68). Removal of smallersize bass ( $\mathrm{n}=171$ ) plus resumption of fertilization in 2016 did not seem to improve bass size structure or bluegill production. Chronic low water levels ( $6-12 \mathrm{ft}$. reductions) from late-summer through fall still plague the lake annually and likely serve to confound bass and sunfish interactions.

Table 1. Lake sampling conditions in the Southwestern Fisheries District in 2018.

| Lake | Date | Species | Weather | Water temp. surface (F) | Conductivity (umhos) | Secchi <br> (in.) | Comments |

Figure 1. 2018 Green River Lake angler attitude survey results

\title{
Green River Lake Angler Attitude Survey 2018 ( \(\mathrm{n}=181\) )
}
1. Have you been surveyed this year? Yes - stop survey

No - continue
2. Name \(\qquad\) (Optional) and Zip Code \(\qquad\)
3. On average, how many times do you fish Green River Lake in a year? \((\mathrm{n}=165)\) First time (1.8\%) 1 to 4 (21.7\%) 5 to 10 (10.2\%)

More than 10 (66.3\%)
4. Which species of fish do you fish for at Green River Lake (check all that apply)? Bass 59.7\% Crappie 56.4\% Catfish 15.5\% Walleye 5.5\% Bluegill 7.2\% Muskie 5\%
5. Which one species do you fish for most at Green River Lake (check only one)? ( \(\mathrm{n}=171\) ) Bass 46.8\% Crappie 43.3\% Catfish 3.5\% Walleye 0.6\% Bluegill 2.3\% Muskie 2.9\%

\section*{-Answer the following questions for each species you fish for - (see question 4)}

Bass Anglers ( \(\mathrm{n}=105\) )
6. In general, what level of satisfaction or dissatisfaction do you have with bass fishing at Green River Lake? Very satisfied \(38.1 \%\) Somewhat satisfied \(49.5 \% \quad\) Neutral \(11.5 \%\) Somewhat dissatisfied 1\% Very dissatisfied 0\% No opinion 0\%
6a. If you responded with very or somewhat satisfied in question (6) - What is the single most important reason for your satisfaction? ( \(n=96\) ) Number of fish 31.3\% Size of fish 66.7\% Size limit 1\% Creel limit \(\square\) Low angler pressure 1\%

6b. If you responded with somewhat or very dissatisfied in question (6) - what is the single most important reason for your dissatisfaction? ( \(n=0\) ) Number of fish \(\square \quad\) Size of fish \(\square \quad\) Size limit \(\square \quad\) Creel limit \(\square \quad\) Too many anglers \(\square\) Other \(\qquad\)
Crappie Anglers ( \(\mathrm{n}=89\) )
7. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Green River Lake? Very satisfied \(40.4 \%\) Somewhat satisfied 52.5\% Neutral 1.1\% Somewhat dissatisfied 5.6\% Very dissatisfied 0\% No opinion 0\%
7a. If you responded with very or somewhat satisfied in question (7) - What is the single most important reason for your satisfaction? ( \(\mathrm{n}=81\) ) Number of fish \(63 \%\) Size of fish \(27.2 \%\) Size limit 2.5\% Creel limit 2.5\% Low angler pressure 0\% Close by 3.7\%

7b. If you responded with somewhat or very dissatisfied in question (7) - what is the single most important reason for your dissatisfaction? ( \(\mathrm{n}=9\) ) Number of fish \(22.2 \%\) Size of fish \(44.4 \%\) Size limit \(11.1 \%\) Creel limit \(11.1 \%\) Too many anglers \(11.1 \%\)

\section*{Catfish Anglers ( \(\mathrm{n}=19\) )}
8. In general, what level of satisfaction or dissatisfaction do you have with catfish fishing at Green River Lake? Very satisfied \(47.2 \% \quad\) Somewhat satisfied \(42.1 \% \quad\) Neutral \(0 \% \quad\) Somewhat dissatisfied \(10.5 \%\) Very dissatisfied 0\% No opinion 0\%
8a. If you responded with very or somewhat satisfied in question (8) - What is the single most important reason for your satisfaction? ( \(\mathrm{n}=17\) ) Number of fish \(76.5 \% \quad\) Size of fish \(23.5 \% \quad\) Size limit \(0 \%\) Creel limit 0\% Other 0\%

8b. If you responded with somewhat or very dissatisfied in question (8) - what is the single most important reason for your dissatisfaction? ( \(\mathrm{n}=2\) ) Number of fish \(50 \% \quad\) Size of fish \(50 \% \square\) Sreel limit \(\square \quad\) Other__ \(\square\)
9. What methods do you use fishing for catfish at Green River Lake? (check all that apply) Jugging 35.7\% Trotline 7.1\% Hook \& Line 53.6\% Hand grabbing/noodling 0\%
9a. How many days per year do you fish using each of the following methods? (enter number of days)
Jugging \(<5=50 \% \quad 6-10=20 \%>10=30 \%\) Trotline \(3=50 \% 4=50 \%\) Hook \& Line \(<5=25.1 \% \quad 6-10=12.6 \% \quad 10-20=12.6 \% 25-50=\) \(6.3 \%>50=12.6 \% \quad\) Hand grabbing/noodling \(0 \%\)

CENTRAL FISHERY DISTRICT
}

\author{
Project 1: Lake and Tailwater Fishery Surveys
}

\section*{FINDINGS}

Lake sampling conditions for 2018 are summarized in Table 1.

\section*{Taylorsville Lake (3,050 acres)}

Spring diurnal electrofishing was completed in April 2018 to assess the black bass population. Three sections (Big Beech Creek, Ashes/Jacks Creek, and Van Buren area) of Taylorsville Lake were sampled for 7.5 hours ( 2.5 hours per section; 30-minute runs). Length distribution and CPUE for largemouth bass are presented in Tables 2 and 3. The catch rate of bass collected in 2019 ( \(184.4 \mathrm{fish} / \mathrm{hr}\) ) was higher than the lake's historical average of \(118.3 \mathrm{fish} / \mathrm{hr}\). Catch rate for keeper bass ( \(\geq 15.0 \mathrm{in}\) ) was \(35.3 \mathrm{fish} / \mathrm{hr}\); higher than the lake average ( \(19.0 \mathrm{fish} / \mathrm{hr}\) ) and was the highest catch rate recorded for harvestable-size fish. The Ashes Creek area recorded its highest catch rate for largemouth bass. The PSD for largemouth bass was 48, which was lower than the lake's average of 56 (Table 4). Additionally, the \(\mathrm{RSD}_{15}\) value was 22 ; which is the lake's average. The largemouth bass population assessment score, based on spring electrofishing data, was 17 "Excellent", which is above the average rating of "Good" at Taylorsville Lake (Table 5).

Length frequency, relative weights, age and growth, and index for year class strength at age- 0 and age- 1 of largemouth bass based on September electrofishing are presented in Tables 6-9. The growth rates of largemouth bass at Taylorsville Lake are very good. Largemouth bass growth rates indicated bass are reaching harvestable size ( 15.0 in ) during the fourth growing season (Table 7). Average body condition for largemouth bass in \(2018\left(\mathrm{~W}_{\mathrm{r}}=92\right)\) was the same as last year, but lower than the lake's historical average ( \(\mathrm{W}_{\mathrm{r}}=96\); Table 8). Catch rate of age-0 largemouth bass in the fall of 2018 ( \(23.7 \mathrm{fish} / \mathrm{hr)}\) ) was lower than the lake's historic average of \(41.1 \mathrm{fish} / \mathrm{hr}\) (Table 9). The year class strength model indicated below average recruitment for young-of-the-year largemouth bass in 2018. Therefore, 30,503 ( 10.0 fish/acre) largemouth bass (4.0-4.5 in) were stocked into Taylorsville Lake in October 2018. Largemouth bass fingerlings have been stocked almost annually since 2000 at rates ranging from 5.0 to 10.0 fish/acre and from 1985 to 1992. The need for stocking and the numbers stocked in reservoirs are based (since 2004) on results of the age-0 year class strength sampled in early September and the predicted age-1 year class strength the following spring.

Trap netting effort for crappie (Table 10) resulted in the collection of 558 white crappie and 116 black crappie. Crappie were sampled with trap nets during 48 net-nights. PSD and \(\mathrm{RSD}_{10}\) values are shown in Table 11. Age and growth determinations and age frequency for black and white crappie were completed using otoliths (Tables 12-15). Age studies indicated both white and black crappie reach 9.0 in between age-2 and age-3. The crappie population assessment scores (Tables 16 and 17) rated both white and black crappie as "Fair". Historically, the crappie population at Taylorsville Lake has been very cyclic with peaks occurring every 7 to 9 years. In an effort to help recruitment on the lake, white crappie were stocked from 2009 through 2013. Significant spawns have occurred in both 2013 and 2015, however the 2016, 2017 and 2018 spawn appeared to be poor based off trap net data. Body condition of white and black crappie in the fall of 2018 were good (Table 18).

Fall gill netting for hybrid striped bass, white bass, and saugeye was conducted in October 2018 (Tables 19-29). A total of 152 hybrid striped bass were collected in 2018 compared to 125 in 2017, 167 in 2016, 47 in 2015, and 90 in 2014. Hybrid striped bass were captured in 13 net-nights (nn) for a CPUE of 11.7 ( \(\pm 5.3\) ) fish \(/ \mathrm{nn}\). The hybrid striped bass population has exhibited notable fluctuations since 1990. The density of hybrid striped bass in Taylorsville Lake appeared to be negatively correlated with the amount of tailwater discharge (due to rainfall) and fishing pressure. It is theorized that above-normal discharge leads to escapement of hybrid striped bass but has little effect on the white bass density in the lake. Additionally, a late fall water quality issue with low oxygen in the lower portion of Taylorsville Lake may be causing additional stress on the hybrid striped bass. Age and growth studies were completed for hybrid striped bass using otoliths (Tables 20 and 21). Data indicate hybrid striped bass reached 15.0 in between one to two years. This is good growth for hybrid striped bass at Taylorsville Lake. The relative weight \(\left(\mathrm{W}_{\mathrm{r}}\right)\) index for hybrid striped bass (87) continues to show a lower than expected body condition at

Taylorsville Lake (Table 22). The average \(\mathrm{W}_{\mathrm{r}}\) for Taylorsville Lake is 86 . The population assessment for hybrid striped bass was rated at "Good", higher than the average rating for hybrid striped bass "Fair" at Taylorsville Lake (Table 23). Taylorsville Lake was stocked with 60,405 (19.8 fish/acre; 1.6 in) hybrid striped bass in June 2018. The 2018 hybrid striped bass stocking in Taylorsville Lake included both crosses of hybrid striped bass ( 30,099 reciprocal cross hybrids (no OTC mark) and 30,306 original cross hybrid striped bass (OTC marked)). Data for white bass collected during fall 2018 gillnetting studies are presented in Tables 19 and 24-27. White bass comprised about \(39 \%\) of the Morones sampled, compared to \(17 \%\) in 2017, \(35 \%\) in 2016, \(27 \%\) in 2015, and \(47 \%\) in 2014, Age and growth studies indicated white bass reach 12.0 in by age 3 (Tables 24 and 25). Relative weight values ( \(\mathrm{W}_{\mathrm{r}}=94\) ) revealed acceptable body condition for all sizes of white bass (Table 26). The white bass population assessment was rated "Poor", an average rating for white bass at Taylorsville Lake (Table 27).

Saugeye were collected during fall gill netting conducted in October. A total of 167 saugeye were collected ranging from the 7.0 - to \(23.0-\mathrm{in}\) size class (Table 19). Age and growth studies were completed using otoliths. Calculations indicated that on average, saugeye reach 15.0 in between age- 1 and age-2, and 20.0 in between age- 2 and age- 3 (Tables 28). All four stocked year classes were represented in this sample (Table 29). Taylorsville Lake was stocked with 61,000 (20.0 fish/acre; 1.1 in ) saugeye in 2018.

Summer diurnal low-pulse electrofishing was completed in July 2018 to assess the blue catfish population. Two sections (Lower Lake: Big Beech Creek and Ashes/Jacks Creek, and Upper Lake: Chowning Lane and Van Buren areas) of Taylorsville Lake were sampled for 3.0 hours ( 15 -minute runs). Two hundred and twenty-eight blue catfish were collected in the lower section compared to 298 blue catfish collected in the upper section of the lake (Table 30). The number of blue catfish collected in 2018 ( \(175.3 \mathrm{fish} / \mathrm{hr}\) ) was higher than the lake's historic average of \(127.5 \mathrm{fish} / \mathrm{hr}\) (Table 31). Relative weight values revealed good body condition for all sizes of blue catfish (Table 32). A total of 23,500 ( 7.7 fish/acre) blue catfish (6.7-7.1 in) were stocked in Taylorsville Lake during October 2018.

\section*{Herrington Lake (2,410 acres)}

Spring diurnal electrofishing studies were completed in May 2018 to monitor the black bass population. Upper, middle, and lower sections were sampled for a total of 7.5 hours ( 2.5 hours per section). Species composition, relative abundance, and CPUE of black bass collected in the spring are presented in Table 33. Largemouth bass ( \(89.6 \%\) ) dominated the black bass fishery at Herrington Lake. Numbers of largemouth bass collected in 2018 ( 184.5 fish \(/ \mathrm{hr}\) ) was higher than the lake's historic average of \(116.7 \mathrm{fish} / \mathrm{hr}\) (Table 34). Fluctuations in the overall catch rates over the past couple of years seem to be related to lake level during sampling. The higher the lake level the lower the catch rate of bass at Herrington Lake. The lake level during the 2018 spring electrofishing sample was low, which may have led to a slight increase in the catch rate for largemouth bass. Catch rate for keeper bass ( \(\geq 12.0 \mathrm{in}\) ) was 88.4 fish \(/ \mathrm{hr}\), higher than the lake's historical average ( \(47.3 \mathrm{fish} / \mathrm{hr}\) ). The PSD for largemouth bass was 64 , comparable to the lake's average of 57 (Table 35). Additionally, the \(\mathrm{RSD}_{15}\) value was 21, which is lower than the lake average of 24. The largemouth bass population assessment score, based on spring electrofishing data, was 19 "Excellent", which is an above average rating for Herrington Lake (Table 36).

Length frequency, relative weights and index of year class strength at age- 0 and age- 1 of largemouth bass based on September electrofishing at Herrington Lake are presented in Tables 37-39. Largemouth bass condition ( \(\mathrm{W}_{\mathrm{r}}=91\) ) was slightly lower than the lake's historical average ( \(\mathrm{W}_{\mathrm{r}}=92\); Table 38). The year class strength model for Herrington Lake indicated a below average recruitment year for young-of-year largemouth bass based on age-1 CPUE (Table 39). Age-0 CPUE ( 11.6 fish/hr) was less than the lake average ( \(35.0 \mathrm{fish} / \mathrm{hr}\) ). Herrington Lake was stocked with 24,172 (10.0 fish/acre) largemouth bass (4.1-4.4 in) in October 2018.

In May 2018, small bass were removed from Beaver Lake to address overcrowding issues. A total of 2,059 largemouth bass (4.0-9.9 in) were removed from Beaver Lake and stocked into Cane Run Creek, which is located in to lower portion of Herrington Lake.

Gill netting for hybrid striped bass and white bass was completed in October 2018. During the 14 net-night sampling period, 162 hybrid striped bass and 46 white bass were collected (Table 40). Otoliths were taken from both species for age and growth determinations. Results of these studies indicated excellent growth rates for both hybrids (Tables 41-42) and white bass (Tables 45-46). Hybrid striped bass continue to reach 15.0 in between age-1
and age-2 (Table 41), as they have historically. Of the hybrid striped bass sampled, \(74 \%\) were age \(-1+\) or older (Table 42). Condition of hybrid striped bass in \(2018\left(\mathrm{~W}_{\mathrm{r}}=97\right)\) was higher than the lake's historical average \(\left(\mathrm{W}_{\mathrm{r}}\right.\) =93; Table 43). The population assessment for hybrid striped bass indicated a "Good" population (Table 44). White bass age and growth determinations showed they reached 12.0 in between age- 1 and age- 2 (Table 45). Of the white bass sampled, \(89 \%\) were age- \(1+\) and older (Table 46). The white bass population assessment indicated a "Fair" population, which is an average rating (Table 47). Body condition of white bass ( \(\mathrm{W}_{\mathrm{r}}=98\) ) was higher than the lake's historical average ( \(\mathrm{W}_{\mathrm{r}}=96\); Table 48). Herrington Lake was stocked with 51,092 (21.2 fish/acre; 1.6 in) hybrid striped bass in June 2018. The hybrid striped bass stocking was divided into 25,880 reciprocal cross hybrids (no mark) and 25,212 original cross hybrids (OTC marked).

A roving daytime angler creel survey was conducted at Herrington Lake from mid-March through October. The last creel survey conducted at this lake was in 2010. Table 49 provides descriptive statistical parameters of the lake fishery during the present survey (2018) and the last 3 surveys (2010, 2004 and 1996). The number of fishing trips in \(2018(13,438)\) increased slightly from \(2010(11,692)\). Accordingly, fishing pressure (man-hours), number of fish caught, numbers and pounds of fish harvested, and catch rates (fish/hr and fish/acre) have increased since 2010. Other parameters such as gender, residency, method and mode were similar to surveys completed in past years.

In 2018, largemouth bass was the predominant black bass species caught; however, spotted bass and smallmouth bass were represented in lower numbers (Tables 50 and 51). Mean length of largemouth bass harvested increased from 13.5 inches in 2010 to 13.9 inches in 2018. Overall, \(12.6 \%\) of largemouth bass were harvested. This number is probably elevated due to the fact this creel considers a tournament angler's fish in the live well as harvested. In most cases, tournament anglers are required to release their fish after weigh-in. Therefore, all tournament anglers harvested bass were changed to released which reduced harvest estimates to \(2.3 \%\) for largemouth bass. The number of fishing trips for black bass in 2018 was 6,653, an increase from 4,207 in 2010. Black bass continued to be the most sought-after group fished for in Herrington Lake. Catch rate of bass by bass anglers were similar from 2018 ( 0.85 fish \(/ \mathrm{hr}\) ) to those in 2010 ( 0.90 fish \(/ \mathrm{hr}\) ). Bass angler success rate ( \(8.0 \%\) ) was less than that reported in \(2010(14.7 \%)\). Black bass catch, harvest and monthly angling success are shown in Tables 52 and 53.

The catfish group was the second most sought after at Herrington Lake. In 2018, there were 1,482 trips by catfish anglers compared to 771 trips by catfish anglers in 2010. Channel catfish contributed \(90 \%\) of the catfish caught, compared to \(78 \%\) in 2010. Pounds of catfish harvested continues to increase from 2,680 lbs in 2004, to \(5,407 \mathrm{lbs}\) in 2010 and \(6,796 \mathrm{lbs}\) in 2018. Pounds of flathead catfish harvested by catfish anglers has remained stable from \(1,542 \mathrm{lbs}\) in 2004, 1,941 lbs in 2010 and \(1,712 \mathrm{lbs}\) in 2018. Mean length of channel catfish harvested by catfish anglers was 15.5 in (13.2 in 2010) while that of flathead catfish was 21.0 in ( 15.5 inches in 2010). Harvest rate by catfish anglers decreased from 0.52 fish \(/ \mathrm{hr}\) (2010) to 0.09 fish \(/ \mathrm{hr}\) (2018). Success rate for catfish anglers in 2018 ( \(75.0 \%\) ) was similar to those observed in 2010 ( \(77 \%\) ). Catfish catch, harvest and monthly angling success are shown in Tables 54 and 55.

Numbers of crappie caught increased from 3,172 in 2010 to 15,773 in 2018. Additionally, the number of crappie harvested increased from 3,045 fish in 2010 to 13,755 fish in 2018. Mean length of crappie harvested was 11.7 in for white crappie and 11.8 in for black crappie. Crappie are the third most sought-after group fished for in Herrington Lake. The number of fishing trips for crappie in 2018 ( 6,487 trips) increased from 1,599 trips in 2004 and 1,506 in 2010. Harvest rate by crappie anglers increased from 0.48 fish/hr in 2010 to 2.01 fish/hr in 2018. Percent success of crappie anglers increased from \(48 \%\) in 2010 to \(79.2 \%\) in 2018. Black crappie represented \(83 \%\) of the crappie caught and \(81 \%\) of the crappie harvested. Crappie catch, harvest and monthly angling success are shown in Tables 56 and 57.

The Morone group (hybrid striped bass and white bass) was the fourth most sought-after group at Herrington Lake in 2018. The number of hybrid striped bass (HSB) caught decreased from 7,309 fish in 2010 to 4,020 fish in 2018. Additionally, the number of hybrid striped bass harvested decreased from 4,408 fish in 2010 to 592 fish in 2018. The number of white bass (WB) caught decreased dramatically from 5,321 fish caught in 2010 ( 3,082 harvested) to 106 fish caught in 2018 (none harvested). Pounds of HSB harvested in 2018 totaled 1,079 lbs ( \(0.45 \mathrm{lbs} / \mathrm{acre}\) ), whereas in 2010 it was \(6,415 \mathrm{lbs}\) ( \(2.66 \mathrm{lbs} / \mathrm{acre}\) ). Mean length of HSB harvested in 2018 was 15.4 in while in 2010 it was 14.2 in. The number of trips for Morones decreased from 2,102 trips in 2010 to 1,187 trips in 2018. Hours spent fishing for these fish also decreased from 10,368 hrs ( \(4.30 \mathrm{hrs} / \mathrm{acre}\) ) in 2010 to \(5,652 \mathrm{hrs}\) ( 2.40
hrs/acre). Harvest rate for Morone anglers decreased from 0.52 fish \(/ \mathrm{hr}\) in 2010 to \(0.07 \mathrm{fish} / \mathrm{hr}\) in 2018. Success rate for these anglers decreased from \(56 \%\) in 2010 to \(16 \%\) in 2018. Morone catch, harvest and monthly angling success are shown in Tables 58 and 59.

Panfish (bluegill) were the fifth most sought after fish group at Herrington Lake in 2018. The number of panfish caught in 2018 (24,794 fish) increased from 20,883 fish caught in 2010. Pounds harvested in 2018 were more than that seen in 2010, increasing from 1,679 lbs ( \(0.70 \mathrm{lbs} / \mathrm{acre}\) ) in 2010 to 2,662 lbs ( \(1.1 \mathrm{lbs} / \mathrm{acre}\) ). The average length of bluegill harvested was 6.1 in , compared to the average size caught in 2010 ( 5.5 in ). Trips for panfish decreased from 1,498 trips in 2010 to 602 trips in 2018. The harvest rate for panfish was \(2.78 \mathrm{fish} / \mathrm{hr}(1.50\) fish/hr in 2010). The percentage of successful panfish anglers was \(53 \%\) while in 2010 it was \(77 \%\). Panfish catch, harvest and monthly angling success are shown in Tables 60 and 61.

An angler attitude survey was conducted at Herrington Lake during the creel survey. Surveys were completed in the field by the creel clerk. A total of 348 surveys were completed by anglers ( 130 surveys in 2010). The attitude survey reflected the largest majority of anglers fish for largemouth bass ( \(61.6 \%\) ) followed by crappie \((15.5 \%)\), channel catfish \((9.9 \%)\), hybrid striped bass ( \(9.9 \%\) ) and other species ( \(7.7 \%\) ). The majority of anglers expressed satisfaction for their species of preference in 2018. The majority of anglers ( \(99.1 \%\) ) are satisfied with the current regulations on Herrington Lake.

\section*{Guist Creek Lake (317 acres)}

Spring nocturnal electrofishing studies were completed for length frequency, CPUE and population assessment for largemouth bass in May 2018 (Table 62). Total largemouth bass catch rate ( \(251.7 \mathrm{fish} / \mathrm{hr}\) ) was higher than the lake average of 167.2 fish \(/ \mathrm{hr}\) (Table 63). The PSD for largemouth bass was 54 compared to the lake average of 66 (Table 64). The \(\mathrm{RSD}_{15}\) was 27 compared to the lake average of 40 . The population assessment gave a rating of "Excellent", the average rating for the past 5 years at Guist Creek Lake (Table 65). Fall largemouth bass sampling was conducted for relative weights and index of year class strength at age-0 and age-1 (Tables 66-68). Relative weights indicated good body condition for bass, especially for bass over 15.0 in (Table 67). Mean length of age-0 largemouth bass ( 4.8 in ) was larger than the lake average of 4.2 in and catch rate of age- 0 largemouth bass ( \(29.3 \mathrm{fish} / \mathrm{hr}\) ) was less than average recruitment (avg. \(=46.3 \mathrm{fish} / \mathrm{hr}\); Table 68). Largemouth bass were stocked at 10.0 fish/acre ( 3,171 fish) that averaged 5.0 in at Guist Creek Lake in October 2018.

Saugeye were collected during the spring largemouth bass sample (Table 62). Sampling yielded 21 saugeye ( \(7.0 \mathrm{fish} / \mathrm{hr}\) ) ranging in size from the \(10.0-\) to \(20.0-\mathrm{in}\) size class. Additionally, saugeye were collected during the fall largemouth bass electrofishing (Table 66). Sampling yielded 19 saugeye ( \(12.7 \mathrm{fish} / \mathrm{hr}\) ) ranging in size from the 8.0 - to 23.0 -in size class. During October, electrofishing was completed targeting saugeye. Nineteen saugeye ( \(12.7 \mathrm{fish} / \mathrm{hr}\) ) were sampled from the 15.0 - to 24.0 -in size class (Table 69 ). Guist Creek Lake was stocked with 28,810 ( 90.9 fish/acre; 1.1 in ) saugeye in 2018. Saugeye have been stocked annually into Guist Creek Lake since 2013.

Guist Creek Lake was stocked with 19,046 (60.1 fish/acre; 1.5 in) hybrid striped bass in June 2018.
Channel catfish were sampled in November using three sets of three tandem hoop nets at Guist Creek Lake in 2018. Although population parameters are presented, only three fish were collected. Length frequency results for channel catfish showed a size distribution between the 7.0-in and 26.0-in size classes (Table 70). The PSD and \(\mathrm{RSD}_{24}\) for channel catfish were 100 and 67 , respectively (Table 71). Relative weights indicated very good body condition \(\left(\mathrm{W}_{\mathrm{r}}=103\right)\) for channel catfish (Table 72). Overall catch rates ( \(1.0 \mathrm{fish} / \mathrm{set}\) ) were much lower than the lake average of 114.4 fish/set (Table 73). Guist Creek Lake was not stocked with channel catfish in 2018.

\section*{A.J. Jolly Lake (175 acres)}

Spring diurnal electrofishing was completed in April 2018 to assess the black bass population (Table 74). Results indicated largemouth bass catch rates ( 110.0 fish \(/ \mathrm{hr}\) ) were greater than the lake's historical average ( 86.7 fish/hr; Table 75). The PSD for largemouth bass was 58 and the RSD \(_{15}\) was 24 (Table 76). The population assessment indicated a "Good" bass population, the average rating since 2010 (Table 77). Fall diurnal electrofishing was conducted for relative weights and to index year class strength of age-0 largemouth bass in October (Tables 78-
80). Relative weights indicated acceptable body condition ( \(\mathrm{W}_{\mathrm{r}}=87\); Table 79). Fall sampling indicated an above average number of age- 0 bass, ( \(42.5 \mathrm{fish} / \mathrm{hr}\); average \(=25.3 \mathrm{fish} / \mathrm{hr}\) ) and above average size of age -0 bass ( 5.3 in ; average=4.6 in; Table 80). Largemouth bass were not stocked during 2018.
A.J. Jolly Lake was stocked with 14,830 ( 84.7 fish/acre; 1.1 in ) saugeye in 2018. Saugeye have been stocked annually since 2013. Saugeye were collected during the spring largemouth bass sample (Table 74). Sampling yielded 19 saugeye ( \(7.6 \mathrm{fish} / \mathrm{hr}\) ) ranging in size from the 8.0 - to 23.0 -in size class. Additionally, saugeye were collected during the fall largemouth bass sample (Table 78). Sampling yielded 48 saugeye ( \(24.0 \mathrm{fish} / \mathrm{hr}\) ) ranging in size from the 9.0 - to 24.0 -in size class.

Channel catfish were not stocked into A.J. Jolly Lake in 2018.
On June 13, 2018 a total of 170 common carp were removed from AJ Jolly Lake. The average weight of a common carp removed from AJ Jolly Lake was 3.8 lbs . Therefore, it was estimated that 646 lbs of common carp were removed. The eight-year total for common carp removed from AJ Jolly Lake is 2,124 fish at an estimated weight of \(6,913 \mathrm{lbs}\) ( 3.3 lbs average weight per fish).

\section*{Beaver Lake (158 acres)}

During March, April, September and November, an effort was made to reduce the crowded largemouth bass population at Beaver Lake. Four thousand four hundred sixty-two ( 28.2 fish/acre) largemouth bass were removed from Beaver Lake during five separate events with fish transported to Herrington, Willisburg and 4 FINS lakes. Largemouth bass ranging in size from 4.0 to 11.0 in ( \(<8.0 \mathrm{in}=2,574\) ( \(57.9 \%\) ); 8.0-10.9 in \(=1,728\) ( \(38.7 \%\) ); 11.0 in \(=160(3.4 \%))\) were removed from Beaver Lake.

A spring diurnal electrofishing sample was completed in May 2018 to assess the black bass population (Table 81). The CPUE for all sizes was \(386.5 \mathrm{fish} / \mathrm{hr}\), greater than the lake average of \(255.0 \mathrm{fish} / \mathrm{hr}\) (Table 82). The PSD and \(\mathrm{RSD}_{15}\) for largemouth bass were 13 and 1, respectively, compared to the current lake average of 28 and 4 (Table 83). The population assessment score indicated a "Fair" bass population (Table 84), compared to the average assessment rating of "Good" for Beaver Lake. Fall diurnal electrofishing was conducted for age and growth, relative weights, and index age-0 year class strength of largemouth bass (Tables \(85-88\) ). Largemouth bass growth rates at Beaver Lake indicated bass are reaching harvestable size ( 12.0 in) between age 4 and age 5 (Table 86). Additionally, the age and growth study showed largemouth bass were reaching 15.0 in between age 7 and age 8 . The overall relative weight index continues to improve following efforts to reduce overcrowding of largemouth bass \(\left(\mathrm{W}_{\mathrm{r}}=86\right)\); which is higher than the lake average of 85 (Table 87). Fall sampling indicated above average numbers of age-0 bass, ( \(196.0 \mathrm{fish} / \mathrm{hr}\); average \(=134.1 \mathrm{fish} / \mathrm{hr}\) ) and the average size of largemouth bass ( 5.2 in ) was higher than the lake's average of 4.3 in (Table 88).

Spring diurnal electrofishing was completed in May 2018 to assess the panfish populations (Tables 89-92). Length frequency results showed a good size distribution of bluegill up to the 8.0 -in size class (Table 89). The PSD for bluegill was 52 compared to the lake average of 32 (Table 90). The \(\mathrm{RSD}_{8}\) was 4 , compared to the lake average of 1. CPUE for all length groups of bluegill was 314.4 fish \(/ \mathrm{hr}\); higher than the lake average of \(252.8 \mathrm{fish} / \mathrm{hr}\) (Table 91). The population assessment for bluegill indicated an "Excellent" population rating, which is above average for Beaver Lake (Table 92). Redear sunfish catch rates were 16.8 fish/hr, which is lower than the lake's average catch rate ( \(66.6 \mathrm{fish} / \mathrm{hr}\) ) for all sizes. The catch rate of redear sunfish \(\geq 8.0\) in was \(4.0 \mathrm{fish} / \mathrm{hr}\) and was lower than the lake average of 22.5 fish \(/ \mathrm{hr}\) (Table 93). Redear sunfish PSD and \(\mathrm{RSD}_{9}\) were 45 and 10, respectively (Table 90). The population assessment indicated a "Good" redear sunfish fishery (Table 94). Relative weights for bluegill and redear sunfish were collected during the fall diurnal electrofishing sample. Overall, relative weight data for bluegill was fair while the body condition of redear sunfish was good (Table 95). Redear sunfish (47,400 fish; 300.0 fish/acre) were stocked in September 2018 at an average size of 1.7 in.

Beaver Lake was stocked with 3,700 (25.0 fish/acre; 7.0-9.0 in) channel catfish in March 2018.
No applications of aquatic herbicides were completed at Beaver Lake in 2018. No liquid fertilizer applications have been made since 2001. Finally, no gizzard shad were collected at Beaver Lake in 2018.

\section*{Benjy Kinman Lake (88 acres)}

A spring nocturnal electrofishing sample was completed in May 2018 at Benjy Kinman Lake to assess the black bass population (Table 96). The CPUE for all sizes was \(128.0 \mathrm{fish} / \mathrm{hr}\), compared to the lake average of 125.4 fish/hr (Table 97). The PSD and \(\mathrm{RSD}_{15}\) for largemouth bass were 24 and 10, respectively (Table 98). The population assessment score indicated a "Fair" bass population (Table 99). Fall largemouth bass sampling was conducted for relative weights and index of year class strength at age-0 in September 2018 (Tables 100-102). Relative weights indicated below average body condition for bass \(\left(\mathrm{W}_{\mathrm{r}}=83\right)\) with larger fish exhibiting better condition compared to smaller length groups (Table 101). The better condition of larger fish is due to the gizzard shad forage base. CPUE for both age- 0 and age- \(0 \geq 5.0\) in were collected for the fifth time at Benjy Kinman Lake (Table 102).

A spring diurnal electrofishing sample was completed at Benjy Kinman Lake in May 2018 to assess the panfish populations (Tables 103-106). Length frequency results showed a good distribution of bluegill through the 6.0 -in size range (Table 103 and 105). The PSD and \(\mathrm{RSD}_{8}\) for bluegill was 35 and 0 , respectively (Table 104). Length frequency results showed the majority of the redear sunfish were in the 4.0- to 7.0-in size range (Table 103 and 106). Redear sunfish PSD and \(\mathrm{RSD}_{9}\) was 7 and 0 , respectively (Table 104). Benjy Kinman Lake was stocked with 26,400 (300.0 fish/acre; 1.7 in ) redear sunfish in September 2018.

Channel catfish were sampled in October 2018 using tandem hoop nets. This was the second channel catfish sample at Benjy Kinman Lake. Length frequency results for channel catfish showed a size distribution between the 13.0 -in and 24.0 -in size class (Table 107). PSD and \(\operatorname{RSD}_{24}\) were 77 and 7 , respectively (Table 108). Catch rates and size distribution have improved since the previous sample in 2015 (Table 109). Relative weights indicated an acceptable body condition for channel catfish \(\left(\mathrm{W}_{\mathrm{r}}=92\right)\) (Table 110).

In July, Big Bone State Park Lake was drained due to a dam issue. Fish were relocated from Big Bone State Park Lake to Benjy Kinman Lake. Benjy Kinman was stocked with 264 (3 fish/acre; 4.0-15.0 in) largemouth bass, 5 ( 0.1 fish/acre; 16.0-17.0 in) channel catfish, and 14 ( 0.2 fish/acre; 6.0-7.0 in) bluegill from Big Bone State Park Lake. In August, General Butler State Park Lake was lowered due to dam repairs. Fish were relocated from General Butler State Park Lake to Benjy Kinman Lake. Benjy Kinman was stocked with 246 ( 2.8 fish/acre; 3.0-19.0 in) largemouth bass, 24 ( 0.3 fish/acre; 12.0-16.0 in) channel catfish, 217 (2.5 fish/acre; 4.0-6.0 in) bluegill, 122 (1.4 fish/acre; 4.0-7.0 in) redear sunfish, and 6 ( 0.1 fish/acre; 6.0-8.0 in) crappie from General Butler State Park Lake.

Eleven rough fish removal events took place from August 2018- December 2018 resulting in a total of 563 bigmouth buffalo, smallmouth buffalo, common carp, freshwater drum and longnose gar being removed from Benjy Kinman Lake. The average weight of rough fish removed in 2018 was 9.7 lbs . Therefore, it was estimated that \(5,475 \mathrm{lbs}\) of rough fish were removed. The five-year total for rough fish removed from Benjy Kinman Lake is 3,953 fish at an estimated weight of \(29,701 \mathrm{lbs}\) ( 7.5 lbs average weight per fish).

A soil test completed during the fall of 2017 at Kinman Lake resulted in a soil pH level of 5.3. Based on the pH it was recommended to apply 5 tons/acre of agricultural lime. Therefore, 121 tons of agricultural lime was washed into the upper third of Kinman Lake during the fall of 2017. During November 2018, 97 tons of agricultural lime was washed into the middle third of Kinman Lake. A total of 218 tons of lime has been washed into Benjy Kinman Lake, which equals a rate of 2.5 tons per acre. The final liming is planned for the lower third of the lake next year.

Kinman Lake was lowered 3.4 feet from October 2018-March 2019 in an effort to crowd the fish, assist with rough fish removal and allow for winter wheat to be planted on the exposed shoreline. A total of 400 lbs . of winter wheat was planted, which should assist in suspending nutrients as it decomposes while providing additional shoreline fish habitat.

One hundred and twenty gallons of liquid fertilizer (9-18-9) was applied in May 2018. During the first treatment, 100 gallons were distributed throughout the entire lake. An additional treatment of 20 gallons was applied in the four upper creek arms of the lake.

\section*{Boltz Lake (92 acres)}

Spring nocturnal electrofishing was completed in May 2018 to assess the black bass population (Table 111). Results indicated largemouth bass catch rates ( \(219.5 \mathrm{fish} / \mathrm{hr}\) ) were higher than the lake's historical average (193.1 fish/hr; Table 112). The PSD for largemouth bass was 53 compared to the lake average of 43 (Table 113). The \(\mathrm{RSD}_{15}\) was 12 , lower than the lake average of 17 . The population assessment indicated a "Good" bass population (Table 114). Fall diurnal electrofishing was conducted for length frequency, relative weights and index of age-0 year class strength in September (Tables 115-117). Relative weights indicated acceptable body condition \(\left(\mathrm{W}_{\mathrm{r}}=92\right)\), higher than the lake's average relative weight of 90 (Table 116). Fall sampling indicated above average numbers of age-0 bass, ( \(191.3 \mathrm{fish} / \mathrm{hr}\); average \(=64.2 \mathrm{fish} / \mathrm{hr}\) ) and the average size ( 4.3 in ) was comparable to the lake's average size of 4.2 in (Table 117).

Saugeye were collected during the spring largemouth bass sample (Table 111). Sampling yielded 61 saugeye ( 30.5 fish \(/ \mathrm{hr}\) ) ranging in size from the 9.0 - to 18.0 -in size class. Saugeye were also collected during fall largemouth bass sampling at a rate of 9.3 fish/hr with fish ranging from the 14.0 - to 21 -in size class (Table 115).

Fall sampling for bluegill was completed for age and growth and relative weight index. On average, bluegill have "excellent" growth, reaching 6.0 in between age-2 and age-3 (Table 118). Relative weights reflected above average condition for bluegill \(\left(\mathrm{W}_{\mathrm{r}}=95\right.\); lake average \(\left.\mathrm{W}_{\mathrm{r}}=90\right)(\) Table 119 \()\).

Diurnal fall crappie electrofishing was completed in October 2018 for length frequency, CPUE, age/growth and relative weight. A total of 79 white crappie were collected in 1.25 hrs of electrofishing (Table 120). Age and growth studies indicate that white crappie on average reach 9.2 in at age 3 (Table 121). Relative weights indicated acceptable body condition \(\left(\mathrm{W}_{\mathrm{r}}=89\right)\) (Table 122)

Channel catfish were sampled in October 2018 using tandem hoop nets. Although only four fish were collected, population parameters are provided below. Length frequency from sampling resulted in a size distribution of 15.0 -in to 19.0 -in size classes (Table 123). The PSD and \(\operatorname{RSD}_{24}\) for channel catfish was 75 and 0 , respectively (Table 124). Relative weights indicated "good" body condition for channel catfish ( \(\mathrm{W}_{\mathrm{r}}=94\) ), and were higher than the lake average \(\left(\mathrm{W}_{\mathrm{r}}=92\right.\); Table 125). Overall, catch rates at Boltz Lake remain lower than the lake average of 53.3 fish/hr (Table 126). Channel catfish were not stocked during 2018. An attempt was made to sample blue catfish at Boltz Lake in 2018. A few fish were observed during electrofishing, but were not collected.

Redear sunfish ( 27,600 fish; 300.0 fish/acre) were stocked in September 2018 at an average size of 1.7 in .
A total of 14 common carp averaging \(11.2 \mathrm{lbs} /\) fish were removed from Boltz Lake in May 2018. In total, 587 common carp (estimated \(4,811 \mathrm{lbs}\) ) have been removed from Boltz Lake since 2008.

Boltz Lake does not have a known population of gizzard shad present in the lake; however, during spring largemouth bass sampling an 18.7-inch gizzard shad was collected. This was the first gizzard shad collected in Boltz Lake; therefore, additional observation will be needed to determine the presence of a shad population.

\section*{Bullock Pen Lake (134 acres)}

Spring nocturnal electrofishing was completed in May 2018 to assess the black bass population (Table 127). The total catch rate of largemouth bass ( 225.0 fish \(/ \mathrm{hr}\) ) was much higher than the lake's average catch rate of 143.9 fish \(/ \mathrm{hr}\) (Table 128). The PSD for largemouth bass was 71 , higher than the lake average of 70 (Table 129). The \(\mathrm{RSD}_{15}\) for largemouth bass was 38 , lower than the lake average of 40 . The population assessment for largemouth bass was rated "Excellent"; which is better than the lake's average rating of "Good" (Table 130). Fall diurnal electrofishing was conducted in September to determine length frequency, age and growth, relative weights and index of age-0 year class strength for largemouth bass (Tables 131-134). Age and growth studies show that largemouth bass reach 12.0 in between age 3 and age 4 and 15.0 in between age 5 and age 6 (Table 132). Relative weights indicated acceptable body condition for bass ( \(\mathrm{W}_{\mathrm{r}}=90\) ), but were lower than the lake's average ( \(\mathrm{W}_{\mathrm{r}}=94\) ). Larger fish exhibited better condition compared to smaller length groups, which is a function of the shad forage base (Table 133). Age-0 CPUE ( \(34.0 \mathrm{fish} / \mathrm{hr}\) ) was higher than the lake average ( \(21.7 \mathrm{fish} / \mathrm{hr}\) ); therefore, no largemouth bass were stocked in 2018 (Table 134).

Saugeye were collected during the spring largemouth bass sample. Only one saugeye ( \(0.5 \mathrm{fish} / \mathrm{hr}\) ) was collected (Table 121). Saugeye were not stocked from 2015-2017 due to potential dewatering of the lake for dam repairs. Bullock Pen Lake was stocked with 11,875 ( 88.6 fish/acre; 1.1 in) saugeye in May 2018.

In fall of 2018, KDFWR began construction of a new boat ramp and parking lot at the property that was purchased in 2017 adjacent to the old ramp.

\section*{Corinth Lake (96 acres)}

Spring nocturnal electrofishing was completed in May 2018 to assess the black bass population (Table 135). The total catch rate of largemouth bass ( \(276.5 \mathrm{fish} / \mathrm{hr}\) ) was higher than the lake's average catch rate of 243.4 fish/hr (Table 136). The PSD for largemouth bass was 37, higher than the lake average of 21 (Table 137). The \(\mathrm{RSD}_{15}\) for largemouth bass was 2 , lower than the lake average of 7 . The population assessment for largemouth bass was rated "Good"; the average rating since 2005 (Table 138). Fall diurnal electrofishing for largemouth bass was conducted to determine length frequency, year class strength and relative weight (Tables 139-141). Relative weights of largemouth bass continue to be below average, except for largemouth bass \(\geq 15.0 \mathrm{in}\). The overall relative weight in \(2018\left(\mathrm{~W}_{\mathrm{r}}=84\right)\) was equal to the historical average relative weight at Corinth Lake \(\left(\mathrm{W}_{\mathrm{r}}=84\right.\); Table 140). The year class strength model indicated that 2018 was a below average recruitment year for young-of-year largemouth bass (Table 141). Age-0 CPUE ( \(62.7 \mathrm{fish} / \mathrm{hr}\) ) remained below the lake average ( \(86.7 \mathrm{fish} / \mathrm{hr}\) ); however, largemouth bass were not stocked into Corinth Lake in 2018.

Spring diurnal electrofishing for bluegill and redear sunfish was completed in May 2018 to obtain length frequency, CPUE and population assessment data (Table 142). Bluegill PSD (49) was higher than the lake average of 33 (Table 143). The bluegill catch rate ( 320.8 fish \(/ \mathrm{hr}\) ) continued to increase and was higher than the lake average (243.0 fish/hr; Table 144). The population assessment indicated a "Good" population, which is the average rating (Table 145). The redear sunfish catch rate ( 251.2 fish \(/ \mathrm{hr}\) ) continued to increase and was higher than the lake's average ( 80.8 fish \(/ \mathrm{hr}\); Table 146). Redear sunfish PSD was 49 , lower than the lake average of 56 (Table 143). Catch rate for redear sunfish \(\geq 8.0\) in was \(36.8 \mathrm{fish} / \mathrm{hr}\); remaining higher than the lake average of \(28.7 \mathrm{fish} / \mathrm{hr}\) (Table 146). The population assessment for redear sunfish was rated as "Fair" (Table 147). Fall diurnal electofishing for bluegill and redear sunfish was conducted for age and growth and relative weights. Age and growth studies show that bluegill reach 6.0 in between age 3 and age 4 and redear sunfish reach 8.0 in at age 5 (Table 148-149) Relative weights indicated fair condition for bluegill (88) and good condition for redear sunfish (96; Table 150).

One hundred gallons of fertilizer was applied on May 15, 2018.
A time-lapse camera was installed at Corinth Lake from March 2018- February 2019 to estimate total usage (trips) and pressure (hours) at this public access area. This approach differs from previous daytime roving creel surveys in that these counts capture all usage types (boat anglers, bank anglers and recreational boaters). However, the primary usage of this site was by anglers. The time-lapse camera recorded a picture of the entire fishing area (parking lot, boat ramp and fishing pier) every 10-minutes during daylight hours throughout the study period. Images were analyzed by randomly selecting 16 days each month, which included an a.m. or p.m. period. During those selected dates and times, individual vehicles were selected for each fishing type (trailered boat, carry-down boat, bank), party size per vehicle and total trip lengths were recorded. A total individual vehicle count was also collected for the entire day. From these counts, monthly averages were calculated.

Overall, it was estimated that 5,059 trips were taken to Corinth Lake from March 2018-February 2019. Monthly trip totals ranged from 15 trips in February to 1,239 trips in May (Figure 1). Eighty-six percent of the trips to Corinth Lake occurred from April-September. The average trip length for the year was 3.4 hours. Trip lengths ranged from 2.5 hours in February to 4.8 hours in June. May ( 4,001 hours) and June ( 3,691 hours) recorded the highest usage rates (Figure 2). It was estimated that Corinth Lake received 17,486 hours of recreational pressure during this 12-month study period.

An angler attitude survey was conducted at Corinth Lake while personnel completed annual fish surveys, site maintenance and downloaded pictures from the time-lapse camera. Fifty-two surveys were completed by anglers. The attitude survey reflected the largest majority of anglers fish for largemouth bass ( \(75.0 \%\) ) followed by
bluegill (30.8\%), crappie (26.9\%), channel catfish (15.4\%), redear sunfish (11.5\%) and anything (5.8\%). The majority of anglers expressed satisfaction for their species of preference in 2018, except for crappie anglers. The majority of anglers \((95.9 \%)\) are satisfied with the current regulations on Corinth Lake. Overall, anglers were satisfied with the facilities (parking lot, boat ramp, fishing pier, courtesy dock and restroom) at Corinth Lake. However, while anglers were satisfied with the facilities, several anglers were dissatisfied with the amount of waterfowl and bird excrement on the boat ramp, courtesy dock and parking lot. Other anglers recommended expanding the parking lot and improving areas for bank fishing access.

\section*{Elmer Davis Lake (149 acres)}

Spring diurnal electrofishing studies were conducted in May 2018 for length frequency, PSD and CPUE for largemouth bass (Table 152). The total catch rate ( 331.5 fish \(/ \mathrm{hr}\) ) was higher than the historical lake average of 307.6 fish/hr (Table 153). Largemouth bass PSD and RSD \(_{15}\) were 64 (average \(=30\) ) and 12 (average \(=8\) ), respectively (Table 154). The population assessment indicated an "Excellent" bass population, which has been the average rating since 2016 (Table 155). Fall electrofishing evaluated largemouth bass relative weight and index of year class strength at age-0 (Tables 156-158). Largemouth bass relative weight \(\left(\mathrm{W}_{\mathrm{r}}=87\right)\) was equal to the historical lake average \(\left(\mathrm{W}_{\mathrm{r}}=87\right.\); Table 157). The year class strength model indicated that 2018 was a below average year for young-of-year largemouth bass. Age-0 CPUE ( \(100.7 \mathrm{fish} / \mathrm{hr}\) ) was lower than the lake average ( \(140.3 \mathrm{fish} / \mathrm{hr}\); Table 158). However, no largemouth bass were stocked during 2018.

Diurnal spring electrofishing for length frequency, CPUE, and population assessment data was conducted for bluegill and redear sunfish in May 2018 (Table 159). The total bluegill catch rate ( \(242.4 \mathrm{fish} / \mathrm{hr}\) ) remains lower than the lake average of \(255.3 \mathrm{fish} / \mathrm{hr}\) (Table 160). The PSD value for bluegill (28) was lower than the lake average of 35 (Table 161). The \(\mathrm{RSD}_{8}\) (3) was higher than the lake average of 2 . The population assessment for bluegill was "Good", the highest rating since 2012 (Table 162). The total catch rate of redear sunfish ( 31.2 fish \(/ \mathrm{hr}\) ) was lower than the lake average of 69.5 fish/hr (Table 163). The PSD for redear sunfish was 67 compared to the lake average of 55. The \(\mathrm{RSD}_{9}\) was 57 compared to the lake average of 19 (Table 161). The redear sunfish population assessment indicated a "Good" population, which is equal to the lake's average rating (Table 164). Relative weight index reflects average condition bluegill \(\left(\mathrm{W}_{\mathrm{r}}=94\right)\) and above average condition for redear sunfish \(\left(\mathrm{W}_{\mathrm{r}}=112\right.\); Table 165). Elmer Davis Lake was stocked with 39,600 (266 fish/acre; 1.7 in ) redear sunfish in September 2018.

Channel catfish were sampled in October 2018 using tandem hoop nets at Elmer Davis Lake. Channel catfish collected ranged from the 14.0 - to 26.0 -in size classes (Table 166). Channel catfish were collected at 16.3 fish/set in 2018 which is lower than the lake average of 78.5 fish/set (Table 167). The PSD and RSD 24 for channel catfish was 94 and 4, respectively (Table 168). Relative weights of channel catfish were excellent \(\left(W_{r}=101\right.\); Table 169).

\section*{Kincaid Lake (183 acres)}

Fall diurnal electrofishing for relative weights and index of year class strength at age 0 were conducted in October 2018 (Tables 170-172). Overall, relative weight values for largemouth bass ( \(\mathrm{W}_{\mathrm{r}}=92\) ) were equal to the lake average ( \(\mathrm{W}_{\mathrm{r}}=92\); Table 171). Age-0 CPUE (48.0 fish/hr) was higher than the lake average ( 37.9 fish \(/ \mathrm{hr}\); Table 172). Largemouth bass were not stocked into Kincaid Lake in 2018.

\section*{McNeely Lake (51 acres)}

Spring diurnal electrofishing studies were conducted in April 2018 for PSD, length frequency and CPUE for largemouth bass (Table 173). Total catch rate in 2018 ( 334.0 fish/hr) was higher than the lake average of 229.2 fish/hr (Table 174). Largemouth bass PSD and RSD \(_{15}\) was 36 (average \(=37\) ) and 9 (average \(=11\) ), respectively (Table 175). The population assessment indicated an "Excellent" bass population, compared to the lake average assessment of "Good" (Table 176).

Channel catfish were not sampled at McNeely Lake in 2018. McNeely Lake was stocked with 1,275 (25.0 fish/acre; 7.0-9.0 in) channel catfish in March 2018.

McNeely Lake was stocked with 100 (2.0 fish/acre: 8.0-10.0 in) grass carp in October 2018 for vegetation control.

Currently, McNeely Lake does not contain a population of gizzard shad.

\section*{Big Bone State Park Lake}

During July 2018, electrofishing was completed at Big Bone State Park Lake in an effort to remove fish in response to dam failure and complete dewatering of the lake. Fish removed were relocated to Benjy Kinman Lake in Henry County (Table 177).

\section*{General Butler State Park Lake}

During August 2018, electrofishing was completed at General Butler State Park Lake in an effort to reduce the biomass of sportfish in response to a drawdown to complete dam repairs. Fish removed were relocated to Benjy Kinman Lake in Henry County (Table 178).

\section*{Kentucky River WMA (Boone Tract) Ponds}

Length frequency, relative abundance, and CPUE of fishes collected in August 2018 by electrofishing at the 15 -acre lake on the Boone Tract of the Kentucky River WMA are shown in Table 179. Largemouth bass were collected from the 4.0 - to 15.0 -in size classes. Bluegill were collected up to the 9.0 -in size class. Black crappie were also collected during this sample. No other species of fish were observed.

Length frequency, relative abundance, and CPUE of fishes collected in August 2018 by electrofishing at the 6 -acre lake on the Boone Tract of the Kentucky River WMA are shown in Table 180. Largemouth bass were collected from the 4.0 - to 21.0 -in size classes. Bluegill were collected up to the 8.0 -in size class. Black crappie and redear sunfish were also collected. Gizzard shad, bullhead catfish and smallmouth buffalo were observed while completing this sport fish sample.

Length frequency, relative abundance, and CPUE of fishes collected in August 2018 by electrofishing at the 4 -acre pond (Prather Pond) on the Boone Tract of the Kentucky River WMA are shown in Table 181. Largemouth bass were collected from the 4.0- to 18.0 -in size classes. Bluegill and redear sunfish were collected up to the \(6.0-\mathrm{in}\) and 8.0 -in size classes, respectively. White crappie were also collected. Gizzard shad were observed while completing this sport fish sample.

\section*{Sympson Lake}

Relative abundance and CPUE of largemouth bass collected in April 2018 are shown in Table 182. Largemouth bass were collected from the 5.0 - to 21.0 -in size classes. Good numbers of bass were present above the \(15.0-\) in size limit. Good numbers and size distribution of white crappie was observed during this sample. An abundant population of common carp are also present in the lake.

\section*{Willisburg Lake (126 acres)}

Relative abundance and CPUE of largemouth bass collected in May 2018 are shown in Table 183. Largemouth bass were collected from the 3.0- to 20.0 -in size classes. Good numbers of bass were present above the 12.0 -in size limit. Willisburg Lake was stocked with 1,463 largemouth bass ( 11.6 fish/acre; 4.0-11.0 in) that were removed from Beaver Lake.

Willisburg Lake was stocked with 3,150 (25.0 fish/acre; 7.0-9.0 in) channel catfish in March 2018.

\section*{HERRINGTON LAKE ANGLER ATTITUDE SURVEY 2018}

\section*{(based on 348 surveys)}

17. Name \(\qquad\)
18. On average, how many time do you fish Herrington Lake in a year? ( \(n=341\) ) First time 12.9\% 1 to 4 13.2\% 5 to 10 15.0\% More than 10 58.9\%
19. Which species of fish do you fish for at Herrington Lake (check all that apply)? Bass 59.2\% Crappie 15.5\% Channel catfish 15.8\% Hybrid striped bass 12.9\% Flathead catfish 10.3\% Anything 7.8\% Bluegill 5.5\% White bass 1.2\% Drum 0.3\% Gar 0.3\%
20. Which one species do you fish for most at Herrington Lake (check only one)? ( \(\mathrm{n}=313\) ) Bass 61.6\% Crappie 10.9\% Channel catfish 9.9\% Hybrid Striped Bass 9.9\% Bluegill 3.5\% Anything 2.9\% Flathead catfish 1.0\% Drum 0.3\%

\section*{-Answer the following questions for each species you fish for - (see question 4)}

\section*{Bass Anglers}
21. In general, what level of satisfaction or dissatisfaction do you have with bass fishing at Herrington Lake? ( \(\mathrm{n}=198\) ) Very satisfied 92.9\% Somewhat satisfied 5.1\% Neutral 0.5\% Somewhat dissatisfied 1.5\% Very dissatisfied 0.0\%

6a. If you responded with somewhat or very satisfied in question (6) - what is the single most important reason for your satisfaction? \((n=181)\)
Number of fish 86.7\% Size of fish 12.7\% Low angler pressure 0.6\%
6b. If you responded with somewhat or very dissatisfied in question (6)- what is the single most important reason for your dissatisfaction? \((n=3)\)
Size of fish 66.7\% Size limit 33.3\%
7. Do you fish any bass tournaments on Herrington Lake? ( \(\mathrm{n}=201\) )

Yes 39.8\% No 60.2\%

\section*{Crappie Anglers}
8. In general, what level of satisfaction or dissatisfaction do you have with the crappie fishing at Herrington Lake? ( \(\mathrm{n}=56\) ) Very satisfied \(\mathbf{8 5 . 7 \%}\) Somewhat satisfied \(\mathbf{1 2 . 5} \%\) Neutral 0.0\% Somewhat dissatisfied \(\mathbf{1 . 8 \%}\) Very dissatisfied 0.0\%

8a. If you responded with somewhat or very satisfied in question (8) - what is the single most important reason for your satisfaction? ( \(\mathrm{n}=52\) )
Number of fish 23.1\% Size of fish 76.9\%
8b. If you responded with somewhat or very dissatisfied in question (8) - what is the single most important reason for your dissatisfaction? ( \(\mathrm{n}=1\) )
Number of fish 100.0\%

\section*{White Bass Anglers}
9. In general, what level of satisfaction do you have with the white bass fishing at Herrington Lake? ( \(\mathrm{n}=4\) ) Very satisfied \(\mathbf{7 5 . 0} \%\) Somewhat satisfied \(\mathbf{2 5 . 0 \%}\) Neutral 0.0\% Somewhat dissatisfied 0.0\% Very dissatisfied 0.0\%

9a. If you responded with somewhat or very satisfied in question (9) - what is the single most important reason for your satisfaction? ( \(\mathrm{n}=4\) )
Number of fish 100.0\%
9a. If you responded with somewhat or very dissatisfied in question (9) - what is the single most important reason for your dissatisfaction? \((\mathrm{n}=0)\)

\section*{Hybrid Striped Bass Anglers}
10. In general, what level of satisfaction or dissatisfaction do you have with hybrid striped bass fishing at Herrington Lake? ( \(\mathrm{n}=46\) ) Very satisfied \(95.6 \%\) Somewhat satisfied \(2.2 \%\) Neutral \(0.0 \%\) Somewhat dissatisfied 0.0\% Very dissatisfied 2.2\%

10a. If you responded with somewhat or very satisfied in question (10) - what is the single most important reason for your satisfaction? ( \(\mathrm{n}=45\) )
Number of fish 55.6\% Size of fish 44.4\%

10b. If you responded with somewhat or very dissatisfied in question (10) - what is the single most important reason for your dissatisfaction? \((n=1)\)
Number of fish 100.0\%

\section*{Channel Catfish Anglers}
11. In general, what level of satisfaction or dissatisfaction do you have with channel catfish fishing at Herrington Lake? ( \(\mathrm{n}=57\) ) Very satisfied \(100.0 \%\) Somewhat satisfied \(0.0 \%\) Neutral \(0.0 \%\) Somewhat dissatisfied \(0.0 \%\) Very dissatisfied \(0.0 \%\)

11a. If you responded with somewhat or very satisfied in question (11) - what is the single most important reason for your satisfaction? ( \(\mathrm{n}=57\) )
Number of fish \(\mathbf{4 5 . 6 \%}\) Size of fish 54.4\%
11b. If you responded with somewhat or very dissatisfied in question (11) - what is the single most important reason for your dissatisfaction? ( \(\mathrm{n}=0\) )

Flathead Catfish Anglers
12. In general, what level of satisfaction or dissatisfaction do you have with channel catfish fishing at Herrington Lake? ( \(\mathrm{n}=36\) ) Very satisfied \(\mathbf{9 7 . 2}\) \% Somewhat satisfied 2.8\% Neutral 0.0\% Somewhat dissatisfied \(0.0 \%\) Very dissatisfied 0.0\%

12a. If you responded with somewhat or very satisfied in question (12) - what is the single most important reason for your satisfaction? ( \(\mathrm{n}=35\) )
Number of fish 31.4\% Size of fish 68.6\%
12b. If you responded with somewhat or very dissatisfied in question (12) - what is the single most important reason for your dissatisfaction? ( \(n=0\) )

\section*{All Anglers}
13. Are you satisfied with the current size and creel limits on all sport fish at Herrington Lake? ( \(\mathrm{n}=338\) ) Yes 99.1\% No 0.9\%

13a. If not, which species are you dissatisfied with and what size and creel limits would you prefer? Largemouth bass 12-18 inch slot limit ( \(n=1\) )
Crappie 9 inch size limit ( \(n=1\) )
Crappie 10 inch size limit ( \(n=1\) )
Crappie 30 fish daily creel limit ( \(\mathrm{n}=1\) )

\section*{CORINTH LAKE ANGLER ATTITUDE SURVEY 2018}
(based on 52 surveys)
1. On average how many times do you fish Corinth Lake in a year? \((\mathrm{n}=49)\)

First time \(\mathbf{3 2 . 7 \%} \quad 1\) to \(4 \mathbf{2 4 . 5 \%} \quad 5\) to \(10 \mathbf{1 2 . 2 \%} \quad\) More than \(10 \mathbf{3 0 . 6}\)
2. Which species of fish do you fish for at Corinth Lake (check all that apply)?

Bass 75.0\% Crappie 26.9\% Bluegill 30.8\% Redear sunfish 11.5\% Channel Catfish 15.4\% Anything 5.8\%
3. Which ONE species do you fish for most at Corinth Lake (check only one)?

Bass 64.7\% Crappie 13.7\% Bluegill 9.8\% Redear sunfish 0.0\% Channel Catfish 7.8\% Anything 3.9\%

\section*{-Answer the following questions for each species you fish for - (see question 3)}

\section*{Bass Anglers}
4. In general, what level of satisfaction or dissatisfaction do you have with bass fishing at Corinth Lake? ( \(\mathrm{n}=34\) ) Very satisfied 20.6\% Somewhat satisfied 47.1\% Neutral 20.6\% Somewhat dissatisfied 11.8\% Very dissatisfied 0.0\%

4a. If you responded with very or somewhat satisfied in question (5) - What is the single most important reason for your Satisfaction? ( \(n=24\) )
Number of fish 58.3\% Size of fish 16.7\% Low Angler Pressure 12.5\% Abundant Vegetation 8.4\% Location 4.2\%
4b. If you responded with somewhat or very dissatisfied in question (5) - What is the single most important reason for your
Dissatisfaction? ( \(n=4\) )
Number of fish 50.0\% Size of fish 25.0\% Don't have boat 25.0\%

\section*{Crappie Anglers}
5. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Corinth Lake? ( \(\mathrm{n}=10\) ) Very satisfied 10.0\% Somewhat satisfied 20.0\% Neutral 30.0\% Somewhat dissatisfied 40.0\% Very dissatisfied 0.0\%

5a. If you responded with very or somewhat satisfied in question (6) - What is the single most important reason for your Satisfaction? ( \(n=4\) )
Number of fish 25.0\% Size of fish 75.0\%
5b. If you responded with somewhat or very dissatisfied in question (6) - What is the single most important reason for your Dissatisfaction? ( \(n=3\) )
Number of fish \(\mathbf{1 0 0 . 0 \%}\)

\section*{Bluegill Anglers}
6. In general, what level of satisfaction or dissatisfaction do you have with bluegill fishing at Corinth Lake? ( \(\mathrm{n}=14\) ) Very satisfied \(\mathbf{2 1 . 4} \% \quad\) Somewhat satisfied 50.0\% Neutral 21.4\% Somewhat dissatisfied 7.1\% Very dissatisfied 0.0\%

6a. If you responded with very or somewhat satisfied in question (7) - What is the single most important reason for your Satisfaction? ( \(n=10\) )
Number of fish 50.0\% Size of fish 50.0\%
6b. If you responded with somewhat or very dissatisfied in question (7) - What is the single most important reason for your Dissatisfaction? ( \(n=1\) )
Number of fish 100.0\%

\section*{Redear Sunfish Anglers}
7. In general, what level of satisfaction or dissatisfaction do you have with redear sunfish fishing at Corinth Lake? ( \(\mathrm{n}=6\) ) Very satisfied 16.7\% Somewhat satisfied 66.7\% Neutral 16.7\% Somewhat dissatisfied 0.0\% Very dissatisfied 0.0\%

7a. If you responded with very or somewhat satisfied in question (8) - What is the single most important reason for your Satisfaction? \((\mathrm{n}=5)\)
Number of fish 60.0\% Size of fish 40.0\%
7b. If you responded with somewhat or very dissatisfied in question (8) - What is the single most important reason for your Dissatisfaction? \((\mathrm{n}=0)\)

\section*{Channel Catfish Anglers}
8. In general, what level of satisfaction or dissatisfaction do you have with channel catfish fishing at Corinth Lake? ( \(\mathrm{n}=4\) ) Very satisfied 25.0\% Somewhat satisfied 25.0\% Neutral 50.0\% Somewhat dissatisfied 0.0\% Very dissatisfied 0.0\%

8a. If you responded with very or somewhat satisfied in question (9) - What is the single most important reason for your Satisfaction? ( \(\mathrm{n}=2\) )
Number of fish 50.0\% Size of fish 50.0\%
8b. If you responded with somewhat or very dissatisfied in question (9) - What is the single most important reason for your Dissatisfaction? ( \(n=0\) )

\section*{All Anglers}
9. Are you satisfied with the current size and creel limits on all sport fish at Corinth Lake? ( \(n=49\) ) Yes 95.9\% No 4.1\%

9a. If not, which species are you dissatisfied with and what size and creel limits would you prefer? ( \(\mathrm{n}=2\) ) Largemouth bass 12-15 inch slot limit ( \(n=1\) ) Crappie 9 or 10 inch size limit ( \(n=1\) )
10. In general, what level of satisfaction or dissatisfaction do you have with the current facilities (parking lot, boat ramp, fishing pier, courtesy dock) at Corinth Lake? ( \(\mathrm{n}=50\) )
Very satisfied 38.0\% Somewhat satisfied 54.0\% Neutral 0.0\% Somewhat dissatisfied 8.0\% Very dissatisfied 0.0\%
10a. If you responded with somewhat or very dissatisfied in question (11) - What is the single most important reason for your Dissatisfaction? ( \(n=13\) )
Animal waste on ramp/docks 61.5\% Additional shoreline bank fishing access 23.1\% Need additional parking 15.4\%

\title{
NORTHEASTERN FISHERY DISTRICT
}

\section*{Project 1: Lake and Tailwaters Fishery Surveys}

\section*{FINDINGS}

All sampling conditions can be found in Table 1. This includes dates, temperatures, secchi depths and any other pertinent sampling information during the sampling events.

\section*{Cave Run Lake (8,720a)}

Muskellunge sampling
On March 19,20 and 22, the upper, middle and lower sections of Cave Run Lake were sampled for an assessment of the muskellunge fishery. In total, 101 fish were collected; of those, 51 ( \(50 \%\) ) came from the lower section, 44 \((44 \%)\) came from the middle section and \(6(6 \%)\) came from the upper section (Table 2). Relative weights continue to range from the upper \(80 \%\) to lower \(90 \%\) and show very little statistical difference from relative weights obtained prior to the implementation of the 36.0 -in minimum size limit (Table 3). Once again, average length and weight of known-age fish was determined from marked members of the population. In Cave Run Lake, the fish tend to reach the minimum size limit of 36.0 in between their fourth and fifth year (Table 4). In 2018, the fishery overall was rated as "Fair" with a score of 9 ; this drop is very similar to the one experienced in 2016 with an overall decrease in numbers (Table 5). In October of 2016, Cave Run Lake was stocked with 1,080 young-of-year muskellunge.
\begin{tabular}{|c|c|c|c|}
\hline Year & Marking & \begin{tabular}{c}

\end{tabular} \\
\hline 2018 & No Mark & 1,080 & 12.2 \\
\hline 2017 & Caudal Wire Tag & 2,700 & 12.0 \\
\hline 2016 & Right Cheek Wire Tag & 2,800 & 11.8 \\
\hline 2015 & Dorsal Fin Wire Tag & 1,307 & 13.0 \\
\hline 2014 & Left Cheek Wire Tag & 2,900 & 13.3 \\
\hline 2013 & Right Pectoral Fin Clip & 2,800 & 12.6 \\
\hline 2012 & Left Pelvic Fin Clip & 1,923 & 12.4 \\
\hline 2011 & Right Pelvic Fin Clip & 2,800 & 12.8 \\
\hline 2010 & Left Pectoral Fin Clip & 2,811 & 12.5 \\
\hline
\end{tabular}

Black bass sampling (Spring/Fall)
On May 7-9, the upper, middle and lower sections of Cave Run Lake were nocturnally electrofished for assessment of the black bass population. In total, 1,512 fish were captured. The majority of these fish were largemouth bass \((65 \%)\), followed by spotted bass ( \(33 \%\) ) and smallmouth bass ( \(2 \%\); Table 6). As is normally the case, the percentage of the population represented by spotted and smallmouth bass increases as you head from the upper sections of the lake to the lower sections of the lake. Catch rates were similar to (or slightly higher than) the 1990-2017 average for all length groups of largemouth bass with the exception of the fish under 8.0 in and over 20.0 in , which were less than this average (Table 7). PSD and RSD \(_{15}\) values for largemouth bass demonstrate that the majority of the fish in the lake are below 12.0 in (Table 8). Overall, the largemouth bass population was rated as "good" (Table 9) and the spotted bass population was rated as "fair" (Table 10). In October, a sample of individuals was collected to determine age and growth characteristics for the largemouth bass population. These samples demonstrate that the growth rates continue to be fair (Table 11). Age characteristics were also determined by section of the lake and showed that growth rates did not vary between the areas of the lake (Table 12).

\section*{Crappie sampling}

Over the last week of October, crappie were sampled in the upper reaches of Cave Run Lake with trap nets. In 40 net-nights, 524 crappie were collected (Table 13). As is usually the case, the majority of the fish collected were white crappie ( \(93 \%\) ). PSD and \(\mathrm{RSD}_{10}\) showed that far and away the majority of the fish collected are smaller in size
(Table 14). Relative weights were in the upper 80 to lower 90 percent range (Table 15). The overall assessment of the white crappie fishery at Cave Run Lake was "fair" (Table 16).

\section*{Grayson Lake (1,512a)}

\section*{Black bass sampling (Spring/Fall)}

The black bass population of Grayson Lake was nocturnally electrofished on April 23, 25, and 26. In total, 1,558 fish were collected ranging in size from 3.0 to 20.0 in (Table 17). The majority of these fish (79\%) were largemouth and the remainder were spotted bass ( \(21 \%\) ) and smallmouth bass ( \(>1 \%\) ). Catch rates by length group were either higher than or not different than the average from 1999-2016 (Table 18). The majority of the population of largemouth bass over 8.0 in is under 12.0 in as demonstrated by PSD values (Table 19). The overall assessment of the largemouth bass fishery at Grayson Lake was "fair" (Table 20).

In September, Grayson Lake was nocturnally electrofished for determination of spawning strength of largemouth bass. Indices of year class strength for largemouth bass continue to be on the high end (Table 21) and the lake was once again not stocked with young of year largemouth bass in 2018.

\section*{Crappie sampling}

On 18 October, crappie were sampled in the upper reaches of Grayson Lake by electrofishing. In total, 302 crappie were collected with the majority of those being white crappie ( \(92 \%\); Table 22). PSD and RSD \(_{10}\) showed that far and away the majority of the fish collected are smaller in size (Table 23). Relative weights range from the mid-70's to the lower 90's (Table 24). The overall assessment of the white crappie fishery at Grayson Lake was "good" (Table 25).

\section*{Hybrid striped bass sampling}

From 22-26 October, hybrid striped bass in Grayson Lake were sampled by use of 150 , 5 panel experimental gill nets. In total, 115 fish were collected ranging in size from 7.0 to 24.0 in (Table 26). Relative weights were very similar to previous years (Table 27). A subsample of individuals was collected for determination of age and growth characteristics and this demonstrated fair growth rates (Table 28) and that the majority of the population was made up of individuals from 1-3 years old that ranged in size from 13.0 to 22.0 in (Table 29). The overall assessment of the hybrid striped bass fishery at Grayson Lake was "good" (Table 30). This population assessment was based off of samples collected specifically on Grayson Lake from 2011 to present.

\section*{Clear Creek Lake (39a)}

Black bass sampling (Spring/Fall)
On 25 April, the largemouth bass population was diurnally electrofished to assess the fishery. A total of 85 fish were collected ranging in size from 4.0 to 20.0 in (Table 31). The total catch rate was down from the 10-year average (Table 32). The PSD is also slightly below the 10 -year average; however, \(\mathrm{RSD}_{15}\) is in line with the average (Table 33). The overall assessment for largemouth bass on Clear Creek Lake was "good" (Table 34).

Clear Creek Lake was also diurnally electrofished on 4 October to collect relative weights (Table 36) and assess age class. During that sample, 191 largemouth bass were collected ranging from 2.0 to 19.0 in (Table 35). A sample of the population was kept to determine the back calculated growth. The population was made up of mostly 1-3 year olds with slow growth rates (Table 37).

\section*{Sunfish sampling (Summer)}

On 17 May, sunfish were diurnally electrofished to assess the population. During the sample, 48 bluegill ranging from 3.0 to 8.0 in were collected (Table 38). The overall catch rate of bluegill is lower than it has been in the past 10 years (Table 39). PSD and \(\mathrm{RSD}_{8}\) demonstrate that the majority of the bluegill are stock size with limited amounts breaking into the quality and preferred ranking (Table 40). The bluegill population was not scored this year, but the catch rates of fish over 6.0 in and 8.0 in were poor and fair, respectively (Table 41). Redear sunfish
were also collected during this sample. In total, 15 were collected ranging from 4.0 to 8.0 in (Table 42). Catch rates were extremely low this year; well below the 10-year average (Table 43). The redear sunfish population was not scored this year, but the catch rates of fish over 8.0 in and 10.0 in were good and unscored, respectively (Table 45).

\section*{Greenbo Lake (181a)}

\section*{Black bass sampling (Spring)}

On 2 May, Greenbo Lake was nocturnally electrofished to assess the population. In total, 377 largemouth bass were collected ranging from 2.0 to 23.0 in (Table 46). Catch rate was significantly up across all length groups (Table 47). PSD and \(\mathrm{RSD}_{15}\) mimic the increased catch rates by showing high numbers of both quality and preferred largemouth (Table 48). High numbers of largemouth in the 12.0- to 15.0 -in category and greater than 20.0 in category carried the assessment to a "good" rating again this year (Table 49).

\section*{Miscellaneous}

Hydrilla continues to be a problem at Greenbo Lake. The fall largemouth bass sample was not attempted due to excessive weed coverage. In an effort to reduce the amount of vegetation, grass carp were stocked for a third straight year. Fifty-seven grass carp averaging fifteen inches were stocked this year.

\section*{Creel Survey}

From 01 March to 31 October, a roving creel survey was conducted on Greenbo Lake. In total, there were 5,814 trips on the lake ( 33 trips per acre), and anglers spent a total of 23,189 hours on the lake ( 132 hours per acre; Table 50). The majority of the users on Greenbo Lake are male residents who spend time still fishing from a boat. The most fished for species on the lake was "anything" ( \(2,345.5\) trips), followed by black bass ( \(1,549.7\) trips), panfish ( 725.6 trips), and trout ( 657.5 trips; Table 51 ). The most harvested species were panfish \((3,216)\) followed by trout \((1,562)\) and crappie \((1,319)\). Panfish and trout were also the most caught species ( 7,345 and 1,814 fish, respectively) but bass took third place for total catch \((1,791)\). Success rates were highest for panfish, trout and crappie ( \(35.5 \%\), \(50.4 \%\) and \(39.7 \%\), respectively). Table 52 shows the number of fish harvested and released by in class. This table shows the very low ( \(5 \%\) overall) harvest rate for largemouth bass, but high harvest rates for bluegill, both species of crappie, and trout. On average, 193.7 trips were made a month for largemouth bass, but these ranged from 97.8 trips in October to 319.5 trips in May (Table 53). The most successful month was May with 0.53 fish caught per hour of fishing. Trips made for trout slowly declined from 412.4 in March to 8.5 in July, and the most successful month was March (0.99 fish caught per angler hour; Table 54).

\section*{Angler Attitude Survey}

In conjunction with the creel survey, anglers were asked a series of questions pertaining to their attitudes towards fishing on Greenbo Lake (Table 55). Anglers were only surveyed once in the year. Overall, the most fished for species were bass, sunfish and trout. Those that fished for bass were satisfied ( \(48.1 \%\) ). Those who were not satisfied \((12.9 \%)\) were disappointed in the number of fish and the inability to catch fish \((34.1 \%\) and \(25.0 \%\), respectively). Similarly, the majority of the anglers who fished for sunfish, catfish and trout were also satisfied \((57.0 \%, 47.7 \%\) and \(67.5 \%\), respectively). The majority of the anglers were satisfied with the current size and creel limits ( \(97.2 \%\) ). Finally, \(3 / 4\) of the anglers were aware of the presence of hydrilla in Greenbo, and the same amount of individuals said it did not hinder their fishing experiences. Slightly more than \(1 / 2\) of the anglers know hydrilla is primarily introduced through boaters and about \(1 / 2\) of anglers took precautions to prevent the spread to other lakes.

\section*{Lake Reba (76a)}

\section*{Black bass sampling (Spring/Fall)}

On 18 April, Lake Reba was diurnally electrofished for assessment of the largemouth bass fishery. In total, 286 fish were collected ranging in size from 3.0 to 18.0 in (Table 56). This catch rate was on par with the average from 1995 - 2017, although the majority of the specific length group categories were at or below average (Table 57). Catch rates showed a higher percentage of smaller size classes of fish, and PSD and \(\operatorname{RSD}_{15}\) values echoed this (Table 58). The overall assessment of the largemouth bass fishery at Lake Reba was "good" (Table 59).

Lake Reba was once again diurnally electrofished in the fall to collect indices related to spawning class strength and based on these values the lake was not stocked in 2018 (Table 60).

\section*{Smokey Valley (36a)}

Black bass sampling (Spring/Fall)
On May 01, Smoky Valley Lake was diurnally electrofished for assessment of the largemouth bass fishery. In total, 256 fish were captured ranging in size from 3.0 to 17.0 in (Table 61). Catch rates were similar to (or slightly higher than) the 1990-2017 average for all length groups of largemouth bass (Table 62). PSD and RSD 15 values for largemouth bass demonstrate that the majority of the fish in the lake are below 12.0 in (Table 63). Overall, the largemouth bass population was rated as "fair" (Table 64).

On 8 October, Smoky Valley was again sampled to determine relative weights and age and growth characteristics for the largemouth bass population. For this sample, 249 fish were caught (Table 65) and the relative weight was in the middle 80 's (Table 66). This sample continued to show slower growth rates overall (Table 67) and that the females tended to grow quicker than the males (Table 68).

\section*{Lake Wilgreen (131a)}

Black bass sampling (Spring/Fall)
On April 19, Lake Wilgreen was diurnally electrofished for assessment of the largemouth bass fishery. In total, 185 fish were captured ranging in size from 2.0 to 22.0 in (Table 69). Catch rates, for the most part, were below the 1990-2017 average with the exception of the larger-sized fish, which continue to be above average (Table 70). PSD and \(\mathrm{RSD}_{15}\) values for largemouth bass demonstrate that the majority of the fish in the lake are above 12.0 in and that a healthy number of the fish are also above 15.0 in (Table 71). Overall, the largemouth bass population was rated as "good" (Table 72).

\title{
SOUTHEASTERN FISHERY DISTRICT
}

\author{
Project 1: Lake and Tailwater Fishery Surveys
}

\section*{FINDINGS}

Conditions encountered during sampling at southeastern district lakes are listed in Table 1.

\section*{Lake Cumberland (50,250 acres)}

Lake levels in Lake Cumberland rose to 705 msl in 2013 and 723 msl in 2014 with the completion of repairs to Wolf Creek Dam. Sampling completed after 2013 was conducted in areas that were sampled prior to 2007. Samples from 2007-2012 were conducted in areas farther downstream in the embayments due to reduced water levels during repairs; therefore, any comparisons of the 2007-2012 data should be interpreted accordingly.

\section*{Black Bass Sampling (Spring)}

Diurnal electrofishing studies were conducted at Wolf Creek dam, and in the Faubush Creek, Fishing Creek, and Lily Creek embayments of Lake Cumberland during May 2018 to assess the black bass populations. The lengthfrequency and catch-per-unit-effort (CPUE) of the black bass species collected in each area is shown in Table 2, and the catch-per-hour (by area and length group) of the three black bass species are shown in Tables 3-6. Largemouth bass catch rates decreased in 2018 but remain slightly higher than average. Catch rates of smallmouth and spotted bass in 2018 were higher than rates observed in 2017. The increased catch of spotted bass marks the third straight year of increasing catch rates. Table 7 compares the catch-per-hour by length group of black bass in Lake Cumberland to other SEFD lakes sampled in 2018

Largemouth bass catch rates met three of the four CPUE management objectives (Table 8), and spotted bass greatly exceeded two of the three management objectives (Table 9). The smallmouth bass population met one of the CPUE management objectives (Tables 10).

Largemouth bass populations exhibited excellent size structure, with a PSD value of 85 and an \(\mathrm{RSD}_{15}\) value of 55 (Table 11). It would be good to see a few more fish in the 8.0- to 11.9 -in length group, though. Smallmouth bass and spotted bass populations were also very good, with a PSD value of 61 and an RSD 14 value of 41 for smallmouth bass and a PSD value of 61 and an \(\mathrm{RSD}_{14}\) value of 23 for spotted bass (Table 11). Table 12 compares the size structure of black bass populations in Lake Cumberland to other SEFD lakes sampled in 2018.

\section*{Black Bass Sampling (Fall)}

Diurnal electrofishing was conducted in the Fishing Creek embayment during October to index the largemouth bass year class strength (Tables 13 and 14). Catch rates of age-0 largemouth bass improved in 2018 in relation to the catch rate observed in 2017 (Table 14). Table 15 compares the CPUE of age-0 largemouth bass in Lake Cumberland to other SEFD lakes sampled in fall 2018. Relative weight (Wr) values for largemouth bass and spotted bass collected during October sampling are shown in Table 16. Table 17 compares Wr values for black bass in Lake Cumberland to other SEFD lakes sampled in fall 2018.

\section*{Walleye and White Bass Sampling}

Gill nets were used in November 2018 to evaluate the walleye and white bass populations in the Jamestown/Bugwood, Conley Bottom, and Waitsboro/Burnside areas of Lake Cumberland. A total of 415 walleye were captured in 30 net-nights (nn) for a catch rate of 13.8 fish \(/ \mathrm{nn}\). Length frequency and CPUE of walleye is shown in Table 18. Walleye ranged from 9.0-23.0 in with the mode being the 16.0 -in class ( 84 fish). All of the catch rate management objectives for walleye were met or exceeded (Table 19). Mean length of age-2+ walleye at capture ( 18.7 in ) met the growth objective of 18.0 in (Table 19). Age-growth data for male and female walleye are shown in Tables 20 and 21, respectively. The age-growth for both sexes combined is shown in Table 22. Eight year-classes were represented in the catch, with the 2017 year class (age-1; 59\%) being most abundant (Table 23). The walleye assessment score was 15 (rating=excellent; Table 24). Relative weight (Wr) values for walleye are shown in Table 25.

A total of 11 white bass were captured in 30 net-nights for a catch rate of 0.4 fish \(/ \mathrm{nn}\). Length frequency and CPUE of white bass is shown in Table 18. White bass ranged from 9.0-16.0 in with the mode being the 10.0 -in class ( 7 fish). The age-growth data for white bass collected during 2018 is shown in Table 26. Three year-classes were represented in the catch, with the 2018 year class (age-0; 82\%) being the most abundant (Table 27). Relative weight \((\mathrm{Wr})\) values for white bass are in Table 25.

Striped bass were also recorded during walleye gill netting. Thirty net-nights captured 123 striped bass for a catch rate of \(4.1 \mathrm{fish} / \mathrm{nn}\). Length-frequency and CPUE of striped bass are shown in Table 18. Striped bass ranged from 7.0 to 31.0 in with the mode being the 18.0 -in class ( 31 fish ). The age-growth data for striped bass collected during 2018 is shown in Table 28. Eight year-classes were represented in the catch, with the 2017 (age-1) year class being the most abundant ( \(59 \%\) ) year class collected (Table 29). Relative weight ( Wr ) values were good for striped bass \(<20.0\) in, but condition values decreased as fish grew larger (Table 25).

\section*{Cumberland Tailwater}

\section*{Trout Sampling (Fall)}

Nocturnal electrofishing sampling was conducted October 28 and 292018 to assess the trout population in the Lake Cumberland tailwater. Electrofishing was completed in seven different areas of the tailwater. Table 30 has the length-frequency and CPUE for the two trout species collected in each area. Brook trout were not observed during the sample. Catch rates of rainbow trout 18.0-19.9 in and greater than 20.0 in improved slightly in 2018, but still remain relatively low (Table 31). Brown trout catch rates continue to decline and remain at or below the 24-year average for the tailwater (Table 32). Relative weight (Wr) values for each trout species is shown in Table 33.

\section*{Laurel River Lake (6,060 acres)}

\section*{Black Bass Sampling (Spring)}

Electrofishing sampling was conducted during April and May 2018 to assess the black bass population in Laurel River Lake. Electrofishing was conducted in four areas of the lake: 1) dam, 2) Spruce Creek, 3) Laurel River arm, and 4) upper Craigs Creek. Length-frequency and CPUE of the three black bass species collected in each area is shown in Table 34. The catch-per-hour (by area and length group) of the three black bass species are shown in Tables 35-38. Catch rates for largemouth bass were lower in 2018 than in previous years of sampling. Catch rates of \(\geq 15.0\)-in largemouth bass decreased in 2018 to \(19.8 \mathrm{fish} / \mathrm{hr}\); however, this catch rate is still above average for the lake. Catch rates of spotted bass increased slightly in 2018, which marks the third straight year of increasing catch rates for spotted bass. Smallmouth bass catch rates were higher in 2018, which was due to an increase in the number of bass less than 8.0 in . Table 7 compares the catch-per-hour by length group of black bass in Laurel River Lake to other SEFD lakes sampled in 2018.

The largemouth bass population met three of the four catch rate objectives (Table 39). Spotted bass met one of the three catch rate management objectives (Table 40). The smallmouth bass population did not meet any of the catch rate management objectives (Table 41).

Largemouth bass exhibited an excellent size structure, having a PSD value of 73 and an \(\mathrm{RSD}_{15}\) value of 35 (Table 42). Smallmouth and spotted bass had a good size structure, with smallmouth bass having a PSD value of 60 and an \(\operatorname{RSD}_{14}\) value of 50 and the spotted bass population having a PSD of 42 and an \(\operatorname{RSD}_{14}\) of 15 (Table 42). Table 12 compares the size structure values of black bass populations in Laurel River Lake to other SEFD lakes sampled in 2018.

\section*{Black Bass Sampling (Fall)}

Diurnal electrofishing was conducted in the Laurel River arm on 4 October 2018 to index largemouth bass year class strength (Tables 43 and 44). Age-0 catch rates in 2018 were higher than average, and no additional largemouth bass were stocked (Table 44). Relative weight (Wr) values for largemouth and spotted bass collected during October sampling are shown in Table 45. Age-growth data from largemouth bass collected in 2018 from Laurel River Lake is shown in Table 46. Growth rates for largemouth bass in Laurel River Lake remain strong, with bass reaching 13.4 in by age- 3 .

\section*{2018 Daytime Creel Survey}

A roving daytime creel survey was conducted on Laurel River Lake (6,060 acres) from March 16-October 312018. The lake was stratified into two survey areas (upper and lower) and the survey was run 16 days per month.

Results of the daytime creel survey are shown in tables 47-53. Anglers took an estimated 19,620 fishing trips during the 2018 creel survey. Based on data collected during past creel surveys, fishing pressure on Laurel River Lake had been on the decline since 1993; however, anglers fished a total of 96,525 man-hours in 2018, which was more than double the number of hours that was observed during the last creel survey in 2010 ( 41,358 man-hours). According to the 2018 creel results, bass anglers accounted for \(73 \%\) of all trips taken, followed by anglers who were fishing for anything ( \(17 \%\) ) and walleye ( \(4 \%\) ). During the creel survey, bass anglers caught 30,964 bass, which resulted in a catch rate of 0.47 fish \(/ \mathrm{hr}\).

\section*{Angler Attitude Survey}

An angler attitude survey was conducted in conjunction with the creel survey to gather angler opinions about the various fisheries at Laurel River Lake (Figure 1). A total of 157 anglers were interviewed. Ninety-eight percent of the anglers interviewed fished for bass, followed by \(27 \%\) of anglers who fished for walleye, and \(13 \%\) who fished for crappie. No anglers indicated that they fished for trout in Laurel River Lake.

Seventy-seven percent of the largemouth bass anglers were satisfied with the largemouth bass fishery at the lake, with the number of fish being the only reason for their dissatisfaction. Only \(50 \%\) of the smallmouth bass anglers were satisfied with the smallmouth bass fishery at Laurel River Lake, which is a drastic decline from the 2010 survey when smallmouth bass angler satisfaction was \(93 \%\). Spotted bass anglers also had a marked decline in their satisfaction, with only \(37 \%\) satisfaction compared to \(64 \%\) in 2010 . Although smallmouth and spotted bass anglers listed the number of fish as the main reason for their dissatisfaction, they also listed too many tournaments and anglers, as well as not enough enforcement, for reasons for angler dissatisfaction.

Fifty percent of the crappie anglers were satisfied with the crappie fishery. Of the crappie anglers dissatisfied with the fishery, the number of fish was the only reason for their dissatisfaction.

Seventy-six percent of the walleye anglers were satisfied with the walleye fishery at Laurel River Lake. Of the walleye anglers that were dissatisfied with the fishery, the number on fish was the only reason listed for their dissatisfaction.

Almost \(80 \%\) of the anglers support the current regulations on Laurel River Lake. Anglers who did not support the current regulations wanted more restrictive size regulations on black bass and crappie species.

Additional questions were asked to gather angler input about the smallmouth bass fishery in Laurel River Lake. These questions revealed that \(27 \%\) of anglers felt fishing for smallmouth bass had improved in the last three years, but \(46 \%\) of anglers felt the smallmouth bass fishing had declined. Anglers would support closures of areas on the lake to create spawning sanctuaries for smallmouth bass. In addition, \(96 \%\) of the anglers were supportive of a catch and release only season during the month of April to protect smallmouth bass during spawning. Anglers were also supportive of a 16 to 21 -in protective slot limit where one fish over 21 inches and one fish under 16 inches may be kept daily for smallmouth bass on Laurel River Lake.

\section*{Cedar Creek Lake (784 acres; Lincoln Co.)}

\section*{Black Bass Sampling (Spring)}

Diurnal electrofishing was conducted on 15 May 2018 to assess the largemouth bass population in Cedar Creek Lake. The length-frequency and CPUE of largemouth bass is shown in Table 54. Size structure of largemouth bass was good (PSD=62, \(\mathrm{RSD}_{15}=50\); Table 55). The catch-per-hour (by length group) of largemouth bass for 2003-2018 is shown in Table 56. Catch rates of largemouth bass in Cedar Creek Lake continue to decline, with marked reductions in fish greater than 12.0 in. Low recruitment from 2011-2014, along with a slight reduction in growth rates, may explain the reduction in fish over 12.0 in . Two of the four CPUE management objectives for the largemouth bass population were met or exceeded (Table 57).

\section*{Black Bass Sampling (Fall)}

Diurnal electrofishing was conducted on 20 September 2018 to index the largemouth bass year-class strength (Tables 58 and 59). Catch rates of age-0 bass in 2018 were lower than 2017 catch rates but were still higher than average (Table 59). Relative weight (Wr) values for largemouth bass are found in Table 60.

\section*{Bluegill/Redear Sunfish Sampling}

Diurnal electrofishing was conducted on 23 May 2018 to assess the bluegill and redear sunfish populations in Cedar Creek Lake. The length-frequency and CPUE of bluegill and redear sunfish is shown in Table 61. The catch-perhour (by length group) of bluegill and redear sunfish is shown in Table 62. PSD and RSD values for bluegill and redear sunfish are shown in Table 63.

\section*{Beulah Lake (87 acres; Jackson Co.)}

\section*{Largemouth Bass Sampling (Spring)}

Diurnal electrofishing was conducted on 3 May 2018 at Beulah Lake to assess the black bass population. Length frequency and CPUE for black bass is shown in Table 64. Catch-per-hour (by length group) for largemouth and smallmouth bass is shown in Table 65. The largemouth bass population remains consistent in the lake. The largemouth bass size structure was poor, with a PSD value of \(17\left(\mathrm{RSD}_{15}=3\right.\); Table 66).

\section*{Bluegill/Redear Sunfish Sampling}

Diurnal electrofishing was conducted on 24 May 2018 at Beulah Lake to assess the bluegill and redear sunfish population. Length-frequency and CPUE for bluegill and redear sunfish is shown in Table 67. Catch-per-hour (by length group) for bluegill is in Table 68. The bluegill population exhibited a fair size structure ( \(\mathrm{PSD}=22, \mathrm{RSD}_{8}=10\); Table 69). The bluegill population assessment score was 10 (rating=good; Table 70). Age-growth for bluegill collected during fall 2018 is shown in Table 71. Relative weight values for bluegill are in Table 72.

\section*{Cannon Creek Lake (243 acres; Bell Co.)}

\section*{Black Bass Sampling (Spring)}

Diurnal electrofishing was conducted on 4 May 2018 at Cannon Creek Lake to assess the black bass population. Length frequency and CPUE for bass are shown in Table 73. The catch-per-hour (by length group) for the three bass species is shown in Table 74. Black bass populations in Cannon Creek Lake had increased catch rates in 2018, but the population still consists of small-sized individuals. Table 75 lists the PSD and RSD values for the black bass species in the lake.

\section*{Dale Hollow Lake (6,746 acres; Kentucky portion)}

\section*{Black Bass Sampling (Spring)}

Diurnal electrofishing was conducted on 7 May 2018 in the Illwill Creek and Little Sulphur Creek embayments of Dale Hollow Lake to assess the black bass population. Length frequency and CPUE for the three black bass species are shown in Table 76. The catch-per-hour by length group of the three black bass species are shown in Tables 7779. Catch rates for largemouth bass in 2018 were lower than rates observed in 2014 but still remained much higher than average. Catch rates for spotted and smallmouth bass were lower in 2018 than in 2014. Largemouth and smallmouth bass exhibited excellent size structure, with largemouth bass having a PSD value of \(93\left(\mathrm{RSD}_{15}=48\right)\) and smallmouth bass having a PSD value of \(67\left(\operatorname{RSD}_{14}=22\right.\); Table 80\()\). Lack of smaller largemouth bass in the sample was most likely due to poor sampling habitat for that size of fish, which inflated the PSD value. The size structure of spotted bass was poor, having a PSD value of \(32\left(\right.\) RSD \(_{14}=0\); Table 80\()\).

\section*{Largemouth Bass Sampling (Fall)}

Diurnal electrofishing was conducted on 8 October 2018 at Dale Hollow Lake to collect largemouth bass to determine age-growth. Age-growth data from largemouth bass collected in 2018 is shown in Table 81. Growth
rates for largemouth bass in Dale Hollow Lake are excellent, with bass reaching 14.1 in by age-3. Relative weight values for largemouth bass are in Table 82.

\section*{Wood Creek Lake (625 acres; Laurel Co.)}

\section*{Black Bass Sampling (Spring)}

Diurnal electrofishing was conducted on 1 May 2018 in the Pump Station and Dock areas of Wood Creek Lake to assess the black bass population. Length frequency and CPUE for black bass are shown in Table 83. The size structure for largemouth and spotted bass was poor, with largemouth bass having a PSD value of \(33\left(\mathrm{RSD}_{15}=12\right)\) and spotted bass having a PSD of \(41\left(\mathrm{RSD}_{14}=6\right.\); Table 84\()\). Catch-per-hour (by length group) for largemouth and spotted bass are shown in Tables 85 and 86, respectively. The largemouth bass catch rates remain higher than average, due in large part to increasing numbers of bass less than 12.0 in . A largemouth bass population assessment is shown in Table 87. Three of the four catch rate management objectives were met for the largemouth bass population (Table 87).

\section*{Black Bass Sampling (Fall)}

Diurnal electrofishing was conducted on 19 September 2018 in the Pump Station and Dock areas of Wood Creek Lake to index largemouth bass year class strength (Tables 88 and 89). Catch rates of age-0 largemouth bass in 2018 were above average (Table 89); thus, no additional age-0 bass were stocked in the lake during the fall. Relative weight values for largemouth and spotted bass are shown in Table 90.

\section*{Temperature and Dissolved Oxygen}

Temperature and dissolved oxygen profiles were taken at three locations in Wood Creek Lake on 7 July 2018 to address concerns about lack of available habitat for trout in the lake. The results indicated that suitable habitat is available in the mid and lower portions of the lake (Table 91).

Figure 1. Results of the Laurel Rive Lake angler attitude survey conducted from March 16-October 31, 2018.

\section*{LAUREL RIVER LAKE ANGLER ATTITUDE SURVEY 2018}
1. Have you been surveyed this year? Yes - stop survey
2. Name \(\qquad\) Zip code \(\qquad\)
3. Have you ever fished at Laurel River Lake before? ( \(\mathrm{N}=157\) ) \(99 \%\) Yes \(\quad \underline{1 \%}\) No If NO, go to question 15.
4. How many times do you fish Laurel River Lake a year? ( \(\mathrm{N}=149\) )
\(\underline{2 \%} 1\) to \(4 \quad \underline{13 \%} 5\) to \(10 \quad\) 85\% More than 10
5. Which species of fish do you fish for at Laurel River Lake (check all that apply)? ( \(\mathrm{N}=224\) )

98\% Bass 13\% Crappie \(\quad\) 0\% Trout \(\quad \underline{27 \%}\) Walleye \(\quad\) 1\% Bluegill \(\quad\) \% Catfish
6. Which one species do you fish for most at Laurel River Lake (check only one)? \((\mathrm{N}=156)\)
93\% Bass \(\quad \underline{3 \%}\) Crappie \(\quad \underline{0 \%}\) Trout Wluegill \(\quad \underline{1 \%}\) Catfish

\section*{-Answer the following questions for each species you fish for - (see question 5) \\ Largemouth Bass Anglers}
7. In general, what level of satisfaction do you have with largemouth bass fishing at Laurel River Lake? ( \(\mathrm{N}=152\) )
\(\underline{22 \%}\) Very satisfied \(\quad \underline{55 \%}\) Somewhat satisfied \(\quad \underline{13 \%}\) Neutral \(\quad \underline{10 \%}\) Somewhat dissatisfied \(\underline{0 \%}\) Very dissatisfied \(0 \%\) No opinion
7a. If you responded with somewhat or very dissatisfied in question (7) - what is the single most important reason for your dissatisfaction? \((\mathrm{N}=15)\)

100\% Number of fish \(\quad \underline{0 \%}\) Size of fish \(\underline{0}\) Not happy with regulations \(0 \%\) Too many anglers/boaters

Smallmouth Bass Anglers
8. In general, what level of satisfaction do you have with smallmouth bass fishing at Laurel River Lake? ( \(\mathrm{N}=153\) ) \(\underline{20 \%}\) Very satisfied \(\quad \underline{30 \%}\) Somewhat satisfied \(\quad 13 \%\) Neutral \(\quad \underline{24 \%}\) Somewhat dissatisfied \(\quad 12 \%\) Very dissatisfied 1\% No opinion
8a. If you responded with somewhat or very dissatisfied in question (8) - what is the single most important reason for your dissatisfaction? \((\mathrm{N}=57)\)

93\% Number of fish \(0 \%\) Size of fish \(0 \%\) Not happy with regulations \(2 \%\) Too many anglers/boaters \(\underline{2 \%}\) Not enough enforcement \(4 \%\) Too many tournaments

Spotted Bass Anglers
9. In general, what level of satisfaction do you have with spotted bass fishing at Laurel River Lake? ( \(\mathrm{N}=141\) ) \(\underline{4 \%}\) Very satisfied \(\quad \underline{33} \%\) Somewhat satisfied \(\quad \underline{34 \%}\) Neutral \(\underline{24 \%}\) Somewhat dissatisfied Very dissatisfied No opinion
9a. If you responded with somewhat or very dissatisfied in question (9) - what is the single most important reason for your dissatisfaction? ( \(\mathrm{N}=36\) )
\(\underline{97 \%}\) Number of fish \(\underline{0 \%}\) Size of fish \(\underline{0 \%}\) Not happy with regulations \(\quad\) \% Too many anglers/boaters 3\% Too many tournaments

\section*{Crappie Anglers}
10. In general, what level of satisfaction do you have with crappie fishing at Laurel River Lake? ( \(\mathrm{N}=20\) )

5\% Very satisfied \(\underline{45 \%}\) Somewhat satisfied \(\underline{20 \%}\) Neutral \(\underline{30 \%}\) Somewhat dissatisfied \(\underline{0 \%}\) Very dissatisfied No opinion

10a. If you responded with somewhat or very dissatisfied in question (10) - what is the single most important reason for your dissatisfaction? ( \(\mathrm{N}=6\) )

\section*{EASTERN FISHERY DISTRICT}

Project 1: Lake and Tailwater Fishery Surveys

\section*{FINDINGS}

Table 1 shows sampling conditions by water body for eastern fishery district lakes in 2018.

\section*{Buckhorn Lake}

Muskellunge were sampled via boat electrofishing during mid-April (Tables 2-4). This was later than the normal sampling time of January - February. Several high water events contributed to the late sample date. Due to the late sample time and low observed numbers, it is presumed that fish had already dispersed into upper lake stream areas. The largest fish collected were in the 36.0 -in class (Table 2). These two fish were females with respective lengths and weights of \(36.2 \mathrm{in}, 13.13\) pounds and \(36.8 \mathrm{in}, 14.68\) pounds. Possibly two fish larger \(\geq 36.0\) in fish were observed and not caught. Fish were sampled from 11.3-36.8 in (Table 2). Relative weights by length group are listed in Table 3 and the \(\log _{10}\) length-weight equation for muskellunge during 2018 sampling was \(-4.34+3.50\left(\log _{10}\right.\) length). An assessment rating of "Poor" was observed for the fishery (Table 4). The assessment ratings of the last two years have both rated "Poor" (Table 4), but the 2017 and 2018 sample events were conducted during poor conditions. The 2018 hatchery production of muskellunge was low, therefore the stocking rate was reduced from a planned rate of 0.33 fish/acre to 0.12 fish/acre. Total number stocked in October was 150 with an average size of 12.2 in. Stocking sites included the marina and Trace Fork boat ramps. These fish were marked with a left pectoral fin clip.

Spring and fall electrofishing was used to sample black bass (Tables 5-10). Largemouth bass were only sampled to 17.0 inches in the spring (Table 5). This influenced assessment values of larger fish resulting in a population assessment of "Fair" (Table 8). Prior assessments from 2015 and 2017 were "Good". Additionally, the fall sample was collected early to acquire age-0 data for determination of stocking needs and did not collect larger fish either. Recruitment has been good in recent years and during fall sampling, another above average CPUE was observed for age-0 fish (Table 10). No supplemental stocking of largemouth bass was necessary.

During 2019, white crappie will be sampled in the fall with trap nets for updated population statistics.
Approximately 5,000 rainbow trout (8.0-12.0 in) were stocked in the tailwater during the months of April-June and October-November.

\section*{Carr Creek Lake}

Black bass were sampled with electrofishing in the spring and fall (Tables 11-16). There was a good size distribution in both sample efforts. The spring largemouth bass population assessment was "Good", which it has been five of the last 6 years (Table 14). Some of the spring age-1 CPUE's for largemouth bass have been high in recent years due to supplemental stocking in the spring instead of the fall (Table 16). Total age-0 largemouth bass numbers in the fall were considered average; however, a decision was made to stock supplemental fingerling bass in the spring of 2019. No smallmouth bass were collected in either the spring or the fall samples. However, they continue to make up part of the black bass fishery as observed in early spring walleye sampling. During March 2018, a total of 7,104 largemouth bass fingerlings ( 6.2 in) were stocked to supplement the 2017 age- 0 class.

Walleye were sampled in the early spring with electrofishing (Tables 17-19). Additionally, during this sampling effort, broodfish were collected for Minor Clark Fish Hatchery. The size distribution of 14.0-26.0 in and the total CPUE was comparable to the last several years (Table 17). Relative weight values were just under 100 for fish \(\geq\) 20.0 in (Table 19). This value is influenced by the high number of males collected. The \(\log _{10}\) length-weight equation for walleye during 2018 sampling was \(-3.31+2.92\) ( \(\log _{10}\) length). A total of 35,052 walleye ( 1.5 in ) were stocked in May.

During June, 100 grass carp were stocked for control of hydrilla in the lake. Tailwater stockings included 1000 rainbow trout/month during the months of April, May, June, October and November.

Tentative scheduling will include early spring electrofishing in 2019 to collect black and white crappie population data.

\section*{Cranks Creek Lake}

Tables 20-25 contain black bass data from spring and fall boat electrofishing at Cranks Creek Lake. Largemouth bass are the dominant black bass species and produce some trophy-size fish at this lake. Length distribution of largemouth bass ranged from 3.0-23.0 in (Table 20). CPUE of largemouth bass \(\geq 20.0\) in has predominantly been greater than 5.0 fish/hr since 2010 (Table 21). The population assessment of largemouth bass in the spring was "Fair" (Table 23). Fall total CPUE of age-0 and age- \(0>5.0\) in was above average (Table 25) and supplemental stocking of largemouth bass fingerlings was not required.

Rainbow trout (1,250 fish/mo) were stocked in the tailwater in January, April, May, and October. Approximately 2,640 channel catfish were stocked in the lake. No herbicides were applied in 2018 for aquatic vegetation control in the upper end of the lake. Grass carp and some early muddy water conditions were sufficient controls for nuisance vegetation during the year.

\section*{Dewey Lake}

Black bass sampling was completed during the spring and fall (Tables 26-32). Largemouth bass numbers greater than 15.0 in continue to be very good (Table 27) and have resulted in attracting a good number of tournaments to the lake. PSD values are near or above 60 for lower and upper lake fish (Table 28), showing a population with a greater proportion of larger fish. The population assessment for largemouth bass remained "Good" (Table 29), as it has been for the last 6 years (Table 29). The total CPUE of age-0 and age- \(0 \geq 5.0\) in fish was above average (Table 32) and no supplemental age-0 fingerling bass were stocked.

Trap netting was conducted in the fall to sample black and white crappie (Tables 33-40). Total CPUE was 27.6 and 32.7 fish/nn for white and black crappie, respectively (Table 33). Age-3 white crappie (Table 37) and age-4 black crappie (Table 38) were the most numerous age classes for each species. The population assessment was "Good" for white crappie (Table 39) and "Fair" for black crappie (Table 40). Mean total length of age- 2 fish at capture was 8.1 in for white crappie (Table 39) and 6.6 in for black crappie (Table 40). Mean total length at age-2 for either species failed to reach the 9.0 or 10.0 in size desired for currently-used minimum size limits.

A total of 11,000 blue catfish (5.0-9.0 in) were stocked in April. Approximately 140 muskellunge ( 12.6 in) were stocked in late summer. Rainbow trout ( \(1,000 \mathrm{fish} / \mathrm{mo}\); 8.0-12.0 in) were stocked in the Dewey Lake tailwater in April, May, October, and November.

A daytime creel survey was conducted at Dewey Lake from 1 March-31 October 2018 (Tables 41-48). The creel survey was a random roving creel design (date, time, and angler count) and the lake was treated as one area. Surveys consisted of 2-6-hour periods (morning and afternoon). Approximate start times were 0600 morning and 1300 afternoon.

Results of the 2018 creel survey found some differences and similarities with surveys of 2010 and 2007. The number of fishing trips during the 2018 creel survey ( \(\mathrm{N}=7,004\); Table 41) was approximately double of what was observed in previous creel surveys of \(2010(\mathrm{~N}=3,862)\) and \(2007(\mathrm{~N}=3,827)\). However, total angler hours \((27,218)\) in 2018 (Table 41) was similar to the 26,491 hours in 2010 and with both of these surveys having increased effort versus 2007 with 17,907 hours.

Catfish and crappie are popular fisheries at the lake and success rates continued to be good in the 2018 creel survey. The percent fishing success was 46.3 for catfish and 45.5 for crappie (Table 42). This compares well to surveys in 2010 and 2007. During 2010, the percent fishing success was 20.5 for catfish and 46.5 for crappie. The survey in

2007 observed percent success of 26.5 for catfish and 37.2 for crappie. Prior to 2009 , the catfish fishery was composed of channel and flathead catfish. During 2009, a stocking program was initiated for blue catfish, which has continued annually through 2018. This added fishery may account for the increased success rate for catfish in 2018 versus previous creel surveys.

Several catch, harvest, and size statistics were greater in 2018 than other years, which bodes well for increased angler opportunity at the lake. The most numerous fish caught ( \(\mathrm{N}=14,596\) ) and harvested \((\mathrm{N}=4,404)\) was white crappie (Table 42). Total weight of harvested fish was greatest and about equal for channel catfish at 1319.1 lbs and white crappie at 1331.6 lbs (Table 42). Greatest total length of fish caught was 38.0 in for muskellunge (Table 43). However, blue, channel, and flathead catfish were all caught in excess of 30.0 in as well (Table 43).

An angler attitude survey was conducted at the lake to obtain further opinion data. Anglers were asked to answer a series of questions regarding the fishery at Dewey Lake (Appendix A). Anglers were surveyed throughout the creel during 2018 with anglers only being asked the questions once. A total of 48 surveys were completed during the lake creel. Catfish at \(72.9 \%(\mathrm{~N}=35)\) were the most popular species fished for on the lake followed by crappie \(66.7 \%\) ( \(\mathrm{N}=32\) ), largemouth bass \(60.4 \% ~(\mathrm{~N}=29)\), bluegill/redear sunfish \(50.5 \%(\mathrm{~N}=24)\), and muskellunge \(16.7 \%(\mathrm{~N}=8)\). Level of fishing satisfaction was asked for several fish groups (bass, crappie, bluegill/redear, catfish). Angler satisfaction (somewhat to very satisfied) was \(48.3 \%\) for bass, \(45.1 \%\) for crappie, \(52.0 \%\) for bluegill/redear, and \(74.3 \%\) for catfish. Approximately \(10.6 \%\) of anglers use the KDFWR tournament website to plan activities at a particular boat ramp. A total of \(79.2 \%\) of anglers were aware of the presence of hydrilla in the lake. Fish habitat questions found \(78.3 \%\) of anglers feeling that KDFWR-placed attractors/structures improved their fishing results.

\section*{Fishtrap Lake}

Spring flooding and debris issues prevented boat traffic until early June, whereby only fall electrofishing was completed for black bass population data. The previous spring assessment in 2017 was "Fair". This lake experienced an extreme drawdown of approximately 42 ft during the winter of 2016-2017 for hydraulic gate repairs in the dam. Fall length frequencies and CPUE for smallmouth, spotted, and largemouth bass are presented in Table 49. The total largemouth bass CPUE of 227.0 fish/hr is high (Table 49), but consistent for the lake. Age-0 largemouth bass numbers were good (Table 50); however, due to the 2017 draining of the lake, 6,729 (6.2-in) fingerlings were stocked. This was approximately half the normal stocking rate.

Hybrid striped bass and white bass were sampled with gill nets in the fall. A length distribution of 8.0-26.0 in was observed for hybrid striped bass and 6.0-17.0 in for white bass (Table 51). Age and growth data is presented in Tables 52-53 for hybrid striped bass and white bass. Both species are attaining good sizes. Hybrid striped bass ages ranged from age- 0 to age- 5 with age- 1 fish being most numerous (Table 54). White bass ages ranged from age- 0 to age- 7 with age- 1 fish being most numerous (Table 55). Population assessments were "Excellent" for both hybrid striped bass (Table 56) and white bass (Table 57). Relative weights (Wr) are listed in Table 58 and are all slightly below a value of 100 for each length group. This may have been influenced by the length of time that fish were entangled in nets before their removal. The \(\log _{10}\) length-weight equation for hybrid striped bass was \(-3.41+\) \(3.07\left(\log _{10}\right.\) length) and for white bass was \(-3.40+3.06\left(\log _{10}\right.\) length \()\).

Several fish stockings occurred during the year at Fishtrap Lake. A total of 11,200 blue catfish (6.0-9.0 in) were stocked in the lake during April. During June, 3,000 native strain walleye ( 2.5 in ) were stocked in the Levisa Fork River upstream of Fishtrap Lake. A total of 23,338 hybrid striped bass ( 1.5 in) were stocked in June. Rainbow trout ( \(2000 \mathrm{fish} / \mathrm{mo}\) ) were stocked in the tailwater in April, May, June, October and November.

\section*{Martins Fork Lake}

Electrofishing was completed in the spring and fall for black bass and native strain walleye (Tables 59-64). During spring, all four black bass species and native strain walleye were collected (Table 59). However, large fish of any species were not collected. The spring assessment of largemouth bass was "Fair" (Table 62). Large fish were also not collected in the fall electrofishing sample (Table 63); however, the sample was collected early in the fall, with emphasis on collecting age- 0 fish and resulting water temperature was warm. Largemouth bass age- 0 density in the
fall was above average (Table 64), but a decision was made to stock age- 1 fingerlings in the spring of 2019 due to impacts of flooding. There were no walleye collected in the fall sample. Some walleye sampling was done during March for preliminary investigation into potential locations to collect walleye broodfish in early 2019. The native strain walleye have been stocked annually since 2013. During 2019, in addition to spring and fall CPUE and length frequency data collection for black bass and walleye, there will be additional early spring electrofishing for walleye broodfish acquisition.

A total of 3,779 native strain walleye ( 3.2 in ) were stocked in June. Rainbow trout ( \(750 \mathrm{fish} / \mathrm{mo}\) ) were stocked at the tailwater in April, May, June, October and November.

\section*{Pan Bowl Lake}

Largemouth bass were sampled in the spring with electrofishing (Tables 65-68). Fish were sampled from the 4.0- to 23.0-in class (Table 65). CPUE of the smaller length groups was high, resulting in elevated total CPUE (Table 66). Additionally, the PSD value of 7 (Table 67) is very low and relates to high numbers of small fish. During the 1990's to early 2000's, it was common to observe largemouth bass PSD values of 60-70. A population assessment of "Fair" was observed in 2018 (Table 68). This lake was added to the trout stocking program in 2013 and this may assist with increasing the PSD and assessment values for largemouth bass.

\section*{Paintsville Lake}

Tables 69-75 provide spring and fall electrofishing data for black bass. The largemouth bass assessment rated "Fair" which is similar to most previous years (Table 72). Spring CPUE of age-1 fish has been the only value in the assessment that routinely scores high (Table 72). This is influenced by the lake having minimal winter pool drawdown and most shoreline or shallow water areas having dense aquatic plant habitat. During the fall sampling, age and growth information was collected for largemouth bass (Table 74). Mean length of age-3 fish at capture was 11.9 in, slightly better than the 11.2 in observed in 2012. Age-0 largemouth bass CPUE was average (Table 75) and no supplemental stocking of fingerlings took place. The 12.0- to 15.0 -in slot length limit for largemouth bass will be replaced with a minimum length limit of 12.0 in beginning 1 March 2019. The slot length regulation was in effect for 17 years (2002-2018).

Spring electrofishing was not completed for walleye and crappie. Walleye broodfish collection was conducted in March. A total of 17 walleye ( 13 male and 4 female) were sampled from 14.3-30.2 in. The largest fish, a 30.2-in female weighed 11.43 pounds. Relative weights were not calculated as there were insufficient numbers collected.

The lake received a stocking of 4,500 rainbow trout ( \(8.0-12.0 \mathrm{in}\) ) during February. The tailwater trout fishery received 20,000 rainbow trout from April to November and 300 brown trout in April.

\section*{Yatesville Lake}

Electrofishing was utilized to sample black bass during the spring and fall (Tables 76-81). Largemouth bass were collected from 2.8-20.9 inches in the spring (Table 76). The spring assessment was "Good" for largemouth bass (Table 79). This fishery has a large number of tournaments and receives heavy pressure from spring into fall, but assessments for largemouth bass have primarily held at "Good" since 2007 (Table 79). Fall sample data observed above average numbers of age-0 largemouth bass (Table 81) and no supplemental stocking took place.

White crappie were sampled with trap nets in November. A total of 564 fish were collected from 3.3-12.9 in for a CPUE of 56.4 fish/nn (Table 82). Data for PSD/RSD, age and growth, and age frequency can be found in Tables 83-85. Age-3 fish accounted for the greatest numbers of any year class (Table 85). The assessment rating was "Excellent" (Table 86). Additionally, mean length of age-2 fish at capture increased from 5.4 inches in 2016 to 6.3 inches in 2018 (Table 86). The fishery should provide good numbers of keeper-size fish in 2019.

Rainbow trout (750 fish/mo) were stocked in the tailwater of Yatesville Lake in April, May and November.

No Response & 0
\end{tabular}

Q10a. If you responded No to Question 10, which species are you dissatisfied with and what size and creel limits would you prefer?
\begin{tabular}{lr}
\(14 "\) catfish minimum size & Frequency \\
\(15 "\) minimum size on catfish & 1 \\
bass, I would like to see the size brought down to 12 inches & 2 \\
blue and channel catfish combined 15 fish creel with no more than 3 greater than \(25 "\) & 1 \\
crappie 10", 15 fish creel & 1 \\
crappie 10", 15 fish creel & 2 \\
musky \(40 "\) & 1 \\
needs to be size limit on flathead catfish & 1 \\
Total & 1 \\
No Response & 10 \\
\end{tabular}

Q11. Do you fish any tournaments?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 10 & \(20.8 \%\) \\
No & 38 & \(79.2 \%\) \\
Total & 48 \\
No Response & 0
\end{tabular}

Q12. Do you use the KDFWR tournament registration website to register tournaments?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 1 & \(2.1 \%\) \\
No & 47 & \(97.9 \%\) \\
Total & 48 & \\
No Response & 0
\end{tabular}

Q13. Do you use the KDFWR tournament registration website to plan your activity at a particular boat ramp access?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 5 & \(10.6 \%\) \\
No & 42 & \(89.4 \%\) \\
Total & 47 & \\
No Response & 1
\end{tabular}

Q14. Are you aware that the invasive plant Hydrilla is present in Dewey Lake?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 38 & \(79.2 \%\) \\
No & 10 & \(20.8 \%\) \\
Total & 48 \\
No Response & 0
\end{tabular}
\begin{tabular}{lrr} 
Q15. Are you aware that the primary means of introduction of invasive plants is through boaters? \\
& Frequency & Percent \\
Yes & 42 & \(87.5 \%\) \\
No & 6 & \(12.5 \%\) \\
Total & 48 \\
No Response & 0
\end{tabular}

Q16. Do you take precautions after fishing Dewey Lake to prevent the spread of invasive plants to other lakes?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 33 & \(68.8 \%\) \\
No & 15 & \(31.3 \%\) \\
Total & 48
\end{tabular}
\begin{tabular}{lrr} 
Q17. How would you rate the existing fish habitat at Dewey Lake (both natural and manmade)? \\
& Frequency & Percent \\
Very Good & 7 & \(14.6 \%\) \\
Good & 30 & \(62.5 \%\) \\
Fair & 10 & \(20.8 \%\) \\
Poor & 1 & \(2.1 \%\) \\
Very Poor & 0 & \(0.0 \%\) \\
No Opinion & 0 & \(0.0 \%\) \\
Total & 48 \\
No Response & 0
\end{tabular}

Q18. Were you aware KDFWR places fish habitat (e.g. fish attractors/structures at Dewey Lake?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 46 & \(95.8 \%\) \\
No & 2 & \(4.2 \%\) \\
Total & 48 & \\
No Response & 0
\end{tabular}

Q19. Do you regularly fish Dept. placed attractors/structures at Dewey Lake?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 36 & \(78.3 \%\) \\
No & 10 & \(21.7 \%\) \\
Total & 46 & \\
No Response & 2 &
\end{tabular}

Q20. How did you find these attractors/structures?
\begin{tabular}{lrr} 
& Frequency & Percent \\
On my own & 27 & \(60.0 \%\) \\
Friend/word of mouth & 16 & \(35.6 \%\) \\
help put in lake & 1 & \(2.2 \%\) \\
kdfwr - office & 1 & \(2.2 \%\) \\
Total & 45 & \\
No Response & 4 &
\end{tabular}

Q21. Do you feel the addition of Dept. placed attractors/structures has improved your fishing results?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 36 & \(78.3 \%\) \\
No & 5 & \(10.9 \%\) \\
No Opinion & 5 & \(10.9 \%\) \\
Total & 46 & \\
No Response & 2 &
\end{tabular}

Q22. Are you aware that the locations of KDFWR placed attractors/structures are available on the KDFWR website?
\begin{tabular}{lrr} 
& Frequency & Percent \\
Yes & 21 & \(45.7 \%\) \\
No & 25 & \(54.3 \%\) \\
Total & 46 & \\
No Response & 2 & \\
\hline
\end{tabular}

\section*{WESTERN FISHERY DISTRICT}

\section*{Project 3: Technical Guidance}

\section*{FINDINGS}

Table 1. Technical guidance given to pond owners in the Western Fishery District during the 2018 project year (April 1, 2018 - March 31, 2019). Approximately 71 telephone calls to the office regarding technical guidance and stocking were also handled. Additionally, numerous emails were replied to requesting farm pond technical guidance information.
\begin{tabular}{|c|c|c|c|}
\hline \begin{tabular}{l}
County \\
Pond Owner
\end{tabular} & Date of Inspection & Findings & Management Recommendations \\
\hline \multicolumn{4}{|l|}{Calloway} \\
\hline Steve Simmons & 14-Sep & flow through watershed lake, crappie, stunted bass & remove crappie, harvest small bass and large bluegill, place cover for fish \\
\hline Scott Akin & 14-Sep & low alkalinity, stunted bass & lime, control trees on levee, stock bluegill in fall and bass in spring, harvest small bass \\
\hline Judy Outland & 17-Sep & stunted bass, lack of catfish, thermocline & harvest small bass, stock catfish, aerate, lime \\
\hline \multicolumn{4}{|l|}{Lyon} \\
\hline Clarence Adams & 10-Apr & low alkalinity, nothing but stunted bass observed & lime, fertilize, stock bluegill and minnows \\
\hline
\end{tabular}

\section*{NORTHWESTERN FISHERY DISTRICT}

Project 3: Technical Guidance

\section*{FINDINGS}

Requests for technical guidance information were received via e-mails, phone calls, and office visits. Problems included unbalanced populations, new pond construction, stocking, fish disease and fish kills, water quality issues, aquatic vegetation control, and general pond management. The requested information was relayed via phone, e-mail, office visit, and referencing the Pond Management section of the web site. Four on-site visits were conducted in 2018. Three were conducted on May 24, 2018 at the request of the Fort Knox Military Base environmental division staff. One additional visit was conducted in October per request from the Union County Fiscal Court. Information concerning these visits can be found in Table 1.

Table 1. On-site technical guidance provided to pond owners in the Northwestern Fishery District in 2018.
\begin{tabular}{|c|c|c|c|c|}
\hline County & Pond/Lake Ow ner & Date & Findings & Recommendations \\
\hline Meade & Ft Knox: Upper Douglas & 5/24/18 & Healthy, stable fish populationse, clear w ater & Change fertilization program to include pow der 10-52-4 for 2019 \\
\hline & Low er Douglas & 5/24/18 & Healthy, stable fish populations & Continue current management \\
\hline & Sanders Springs & 5/24/18 & Healthy, stable fish populations & Continue current management, encourage sunfish harvest \\
\hline Union & Union County Fiscal Court & 10/16/18 & Healthy, stable fish populations & Continue current management \\
\hline
\end{tabular}

\section*{SOUTHWESTERN FISHERY DISTRICT}

\section*{Project 3: Technical Guidance}

\section*{FINDINGS}

Details of the technical guidance provided during 2018 are shown in Table 1. Technical guidance was provided through nine on-site visits. Additional technical guidance requests were handled over the telephone, walk-in visits, or by written correspondence. Topics encountered and responded to included: fish population balance, water quality problems, fish stocking, and aquatic vegetation problems.

Several other requests for information about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone, email, and walk-in visits.

Table 1. Onsite technical guidance visits during 2018.
\begin{tabular}{lclll}
\hline County & Date & Landowner & Problem/Situation & Recommendations \\
\hline Butler & \(8 / 29\) & Bobby McKey & \begin{tabular}{l}

\end{tabular}

\section*{CENTRAL FISHERY DISTRICT}

\section*{Project 2: Stream Fishery Surveys - Warmwater Streams}

\section*{FINDINGS}

Stream sampling conditions for 2019 are summarized in Table 1.
Diurnal electrofishing for black bass and rock bass was conducted during May 2018 at various locations on Elkhorn Creek. These studies were conducted to assess the black bass, especially smallmouth bass and rock bass populations, but data for all sportfish were collected. Length distribution and CPUE data of sportfish, including black bass and rock bass from Elkhorn Creek are presented in Table 2. Smallmouth bass comprised \(62 \%\) of the black bass sampled in the North Fork Elkhorn Creek, whereas, smallmouth bass comprised \(99 \%\) of the black bass sampled on the main stem Elkhorn Creek. No spotted bass were collected in North Fork Elkhorn Creek and represented \(0.002 \%\) of the black bass population in the main stem Elkhorn Creek. Largemouth bass comprised 38\% of the black bass sampled in the North Fork Elkhorn Creek and \(0.01 \%\) of the black bass sampled in the main stem Elkhorn Creek. The current catch rate of smallmouth bass ( \(85.0 \mathrm{fish} / \mathrm{hr}\) ) is slightly lower than the historical average of \(94.7 \mathrm{fish} / \mathrm{hr}\) (Table 3). The current catch rate of rock bass ( \(20.6 \mathrm{fish} / \mathrm{hr}\) ) was lower than the historical catch rate ( \(31.0 \mathrm{fish} / \mathrm{hr}\); Table 4). The smallmouth bass population assessment score for the North Fork Elkhorn Creek was 19 (Table 5), which results in an "Excellent" rating. The rock bass population assessment score for North Fork Elkhorn Creek was 15 (Table 6), which results in an "Excellent" rating. The largemouth bass population assessment score for North Fork Elkhorn Creek was 16 (Table 7), which results in an "Excellent" rating. Fish populations on the North Fork Elkhorn Creek are affected by two dams in the vicinity of the Great Crossing areas. For the main stem Elkhorn Creek, the smallmouth bass population assessment score was 18 (Table 8), which results in an "Excellent" rating. The rock bass population assessment score was 5 (Table 9), which results in a "Fair" rating. Finally, the largemouth bass population assessment score was 2 (Table 10), which results in a "Poor" rating.

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

Table 2. Length-frequency and CPUE (fish/hr) of selected fish species collected in 5.25 hours of 15-minute electrofishing runs at four sites on Elkhorn Creek in May 2018; numbers in parentheses are standard errors.

\section*{CENTRAL FISHERY DISTRICT}

Project 2: Stream Fishery Surveys - Trout Stream Fishery Surveys

\section*{FINDINGS}

Big Bone Creek at Big Bone State Park was monitored for suitability for trout management. Water temperatures were monitored hourly on Big Bone Creek ( 2 sites) by Hobo TidbiT MX temperature loggers (MX2203) from 15 April to 15 November 2018. The results showed that water temperatures in the upper trout section of Big Bone Creek averaged \(64.2^{\circ} \mathrm{F}\left(\min =36.6^{\circ} \mathrm{F}\right.\) and \(\max =82.0^{\circ} \mathrm{F}\) ) and temperatures exceeded \(72^{\circ} \mathrm{F}\) on 96 different days between 3 May and 11 October (Figure 1). Water temperatures for the lower trout section of Big Bone Creek averaged \(67.9^{\circ} \mathrm{F}\left(\min =37.8^{\circ} \mathrm{F}\right.\) and \(\max =87.0^{\circ} \mathrm{F}\) ) and temperatures exceeded \(72^{\circ} \mathrm{F}\) on 109 different days between 3 May and 11 October (Figure 2). There was a dip in the temperature profile during the end of June and first of July on the upper Big Bone Creek temperature profile. This was due to a water release from the draining of Big Bone Lick State Park Lake due to a dam issue. There was a slug of cool water released during the lake draining.

A time-lapse camera was installed at the Big Bone State Park upstream of the bridge where trout are stocked into Big Bone Creek in 2018. The camera was installed in April in an effort to capture angling pressure following each of the stocking events, which occurred in April, May, and November 2018. The time-lapse camera recorded a picture of the stocking site every 10-minutes during daylight hours. Unfortunately, a camera malfunction occurred in November 2018 and no data was collected from the November stocking. The camera was removed in March 2019. Images were analyzed by recording pressure counts at the top of each hour during daylight hours.

A total of 1,200 (400 fish/stocking) rainbow trout were stocked into Big Bone Creek during 2018. During the two stocking months with data, an average of 39.5 anglers/month was recorded compared to an average of 20.2 anglers/month during non-stocking months (June-October). During the first week following a stocking event, an average of 12.5 anglers \((41.7 \%)\) were recorded, dropping to an average of \(9.5(31.7 \%)\) anglers during the second week and averaged \(8.0(26.6 \%)\) anglers during the third week post stocking. It does appear that anglers are utilizing the rainbow trout that are stocked into Big Bone Creek.

Gunpowder Creek at Sperti Park was monitored for suitability for trout management. Water temperatures were monitored hourly on Gunpowder Creek ( 2 sites) by Hobo TidbiT MX temperature loggers (MX2203) from 15 April to 15 November 2018. The results showed that water temperatures in the upper trout section of Gunpowder averaged \(69.9^{\circ} \mathrm{F}\left(\min =36.7^{\circ} \mathrm{F}\right.\) and \(\left.\max =92.4^{\circ} \mathrm{F}\right)\) and temperatures exceeded \(72^{\circ} \mathrm{F}\) on 150 different days between 1 May and 11 October (Figure 3). Water temperatures for the lower trout section of Gunpowder Creek averaged \(68.2^{\circ} \mathrm{F}\left(\min =23.5^{\circ} \mathrm{F}\right.\) and \(\left.\max =99.8^{\circ} \mathrm{F}\right)\) and temperatures exceeded \(72^{\circ} \mathrm{F}\) on 149 different days between 2 May and 11 October (Figure 4). It is recommended that Gunpowder Creek within Sperti Park be stocked as a put-and-take delayed harvest rainbow trout fishery with stockings in March, April and October (Table 1).

Figure 1. Daily water temperatures observed in the upper reach of the trout section at Big Bone Creek (Boone Co.) from 15 April to 15 November 2018.

Lower Big Bone Creek

Figure 2. Daily water temperatures observed in the lower reach of the trout section at Big Bone Creek (Boone Co.) from 15 April to 15 November 2018.

Figure 3. Daily water temperatures observed in the upper reach of the proposed trout section at Gunpowder Creek (Boone Co.) from 15 April to 15 November 2018.

Figure 4. Daily water temperatures observed in the lower reach of the proposed trout section at Gunpowder Creek (Boone Co.) from 15 April to 15 November 2018.

\author{
Project 3: Technical Guidance
}

\section*{FINDINGS}

A total of 34 pond owners and 41 ponds were visited in 2018. Most common problems were unbalanced fish populations, excessive aquatic plant growth, lack of fish cover, and the presence of undesirable fish species (Table 1). During our 2018 technical guidance sampling, seven landowners requested a Fisheries Special Management Permit (FMP) for their ponds. Finally, a total of 291 phone calls, 206 e-mails, and 8 walk-in office visits concerning farm pond problems were handled this year.

\title{
NORTHEASTERN FISHERY DISTRICT
}

\author{
Project 2: Stream Fishery Surveys
}

\section*{FINDINGS}

\section*{Slate Creek Sampling}

On 7, 8, and 20 June, four sections of Slate Creek (Bath County) were sampled for an assessment of the game fish, sunfish and catfish populations (specific site locations and sampling times can be found in the table below). On 7 June, the downstream (Site 1, White Oak, sampled for 0.5 hours ( \(2-15\)-minute runs)) and the upstream most site (Site 4, Shrout Road, sampled for 0.75 hours ( \(3-15\) minute runs)) were sampled. On 8 June, the second-most upstream site (Site 3, Lion's Club, sampled for 1.0 hours ( \(4-15\) minute runs)) was sampled. On 20 June, the secondmost downstream site (Site 2, Bach Hole, sampled for 0.5 hours ( \(2-15\) minute runs)) was sampled. In total, 11 different species were collected with the dominant species being rock bass ( \(46 \%\) of all individuals) followed by smallmouth bass ( \(30 \%\) of all individuals; Table 1). Catch rates of rock bass are presented in Table 2 and the overall rock bass fishery was rated as "good" (Table 3). Catch rates of smallmouth bass are presented in Table 4 and the overall smallmouth bass fishery was rated as "good" (Table 5). Finally, the largemouth bass catch rates are presented in Table 6 and this fishery was rated as "fair" overall (Table 7).

\section*{Licking River Sampling}

On 4-6 and 20 June, the Licking River was sampled for an assessment of game fish, sunfish and catfish populations. Nine different locations were sampled from the Cave Run Lake dam to the Falmouth area in Pendleton County; specific site locations and sampling times can be found in the table below. Overall sampling showed the abundance of different species that you would expect in such a long stretch of the river and for that reason, tables were broken up by species types. All three species of black bass were collected with smallmouth being the most prevalent ( \(65 \%\) of all individuals; Table 8). Catch rates of smallmouth bass are presented in Table 9 and the overall smallmouth bass fishery was rated as "good" (Table 10). The largemouth bass catch rates are presented in Table 11 and this fishery was rated as "fair" overall (Table 12). Both flathead and channel catfish were collected along the length of the river with channel catfish being the most prevalent ( \(87 \%\); Table 13). The majority ( \(87 \%\) ) of all channel catfish collected came in the Cave Run Tailwater areas. Length frequency for all other species of fish collected is shown in Table 14. The most prevalent species was crappie (white then black) followed by rock bass. Additionally, eight muskellunge were collected, giving an overall catch rate of 0.9 fish per hour of electrofishing. Catch rates of rock bass are presented in Table 15 and the overall rock bass fishery was rated as "fair" (Table 16).

\hline
\end{tabular}

\section*{Kentucky River Sampling}

On 28 November, the tailwaters of Lock and Dam 10 and 12 of the Kentucky River were sampled nocturnally for assessment of the Sander species (1.0 hour in each location; 4-15-minute runs). Between both sections, 39 sauger were collected with the majority coming from the tailwaters of Lock and Dam 10 (Table 17)

\section*{Trout Stream Temperature Assessments}

Temperature loggers were installed in all NEFD trout designated waters. Data collection spanned from May through November. Parched Corn, Chimney Top, and Dog Fork represent the coldest streams in the district. All three are at the upper temperature threshold for trout over-summering habitat (Table 18). At the time of writing, some loggers were unable to be harvested due to excessively high water.

\section*{Trout Stream Usage (Camera Monitoring)}

Trail cameras were placed on streams to assess the number of anglers using the trout-stocked waters. Cameras were installed early May and maintained throughout the year. Big Caney, Triplett, and Swift Camp were all streams that received heavy usage throughout the year (Table 19).

\section*{Trout Stream Sampling}

Three trout streams, with the greatest possibility of having holdover habitat, were sampled throughout the month of July. Trout were found in all three streams. Also during sampling, wild spawned fish were found in Parched Corn Creek (Table 20).

Table 1. Length frequency and CPUE (fish/hour) of selected sport fish collected during 2.75 hours of electrofishing (15-minute sampling runs) at 4 sites in Slate Creek during the spring of 2018.

Project 3: Technical Guidance

\section*{FINDINGS}

Table 1 provides a list of ponds visited (12) in 2018 and our findings and recommendations. In addition to on-site inspections, consultations were rendered via telephone (75-100) and/or written correspondence ( \(\sim 5\) ). Most vegetation problems and a few population problems were resolved using email pictures, pond harvest log data or the use of the "Managing Your Farm Ponds" web page. Technical guidance was provided to individuals from all counties in the NEFD. Typical problems responded to include: pond stocking, aquatic vegetation problems, undesirable species, fishing information, fish kills, farm pond management, fish pathogens, water quality, pond construction, structural problems with dams, and pond nuisances.

\section*{SOUTHEASTERN FISHERY DISTRICT}

\section*{Project 2: Stream Fishery Surveys - Trout Stream Fishery Surveys}

FINDINGS

Three streams in the Southeastern Fishery District were monitored to evaluate the habitat suitability for trout management based on water temperature. Temperature data was collected at two locations within each of the three streams from early-May through mid-December. Water temperature ( \({ }^{\circ} \mathrm{F}\) ) was recorded once every hour. Bark Camp Creek did not record any water temperatures over \(75^{\circ} \mathrm{F}\) during the summer months from June-September, and average monthly temperatures did not exceed \(71^{\circ} \mathrm{F}\) (Table 1). In Cane Creek, maximum water temperatures were just over \(75^{\circ} \mathrm{F}\) in July, and average monthly temperatures did not exceed \(71^{\circ} \mathrm{F}\) (Table 2). Maximum water temperature in Clear Creek exceeded \(77^{\circ} \mathrm{F}\) in July, and the average monthly temperature was greater than \(72^{\circ} \mathrm{F}\) in July (Table 3). The three streams were classified based on four criteria: 1) the number of days that the average daily water temperature exceeded \(72^{\circ} \mathrm{F}\) during the year, 2) the maximum water temperature from June-September, 3) the number of days the average daily water temperature exceeded \(73^{\circ} \mathrm{F}\) in June, and 4) the maximum water temperature in June. Based on the criteria, Bark Camp Creek and Cane Creek were Class II streams, and Clear Creek was a Class III stream (Table 4). All trout streams assessed should continue under current management regimes.

\section*{SOUTHEASTERN FISHERY DISTRICT}

\section*{Project 3: Technical Guidance}

\section*{FINDINGS}

Details of the technical guidance provided during 2018 are shown in Table 1. Technical guidance was provided through nine on-site visits. Additional technical guidance requests were handled over the telephone, or by written correspondence. Topics encountered and responded to included: fish population balance, water quality problems, fish disease, fish stocking, and aquatic vegetation problems.

Several other requests for information (approximately 200) about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone and email.

EASTERN FISHERY DISTRICT
}

\author{
Project 2: Stream Fishery Surveys
}

\section*{FINDINGS}

\section*{Trout Stream Assessments}

Two streams in the trout stocking program were evaluated. Paint Creek in Johnson County and Russell Fork in Pike County were monitored with in-stream devices that recorded water temperature ( \({ }^{\circ} \mathrm{F}\) ) once every hour from April October. Two sites were monitored in Paint Creek, one site in Russell Fork, and one site in Elkhorn Creek near its confluence with Russel Fork. The Elkhorn Creek in Pike County site was monitored as it is utilized as a stocking site for trout in Russell Fork.

All stream sites had supporting temperatures for trout during spring and fall time periods. Recorded minimum and maximum temperature ranges are displayed in Tables 1-2. The trout management plans are different for each stream.

Paint Creek is managed both as a put-take fishery (Paintsville Lake tailwater) and a put-grow-take fishery (special regulation downstream area). Rainbow trout are stocked at a rate of 2,500 fish/mo from April - November and 300 brown trout are stocked in April. Paint Creek immediately below Paintsville Lake does receive trout stockings through the summer. Although maximum summer temperatures at this location are approximately 70 F , a trout fishery is still supported during this time. This portion of Paint Creek or Paintsville Lake tailwater is under statewide regulation for trout and managed as a put-take fishery. Downstream of this area, begins a special fishing regulation for trout in Paint Creek and is considered the put-grow-take fishery. The special regulation area is defined with limits specified as "From the KY 40 bridge downstream to the first U.S. 460 bridge, 16-inch minimum size limit and 1 fish daily creel limit on trout and only artificial baits shall be used". The upper and lower sites of temperature monitoring during 2018 occurred at the halfway and end points of this special regulation area. Observed temperature did exceed 72 F during most months at the upstream and downstream locations (Table 1). However, the upstream location during most months did remain fairly close to 72 F for maximum temperature and when exceeding 72F, it was for a short duration each day/24 hr time period. Since the 2006 changes in Paintsville Lake outflows, the special regulation area has had approximately half of its year-round trout habitat altered or eliminated. Where the special regulation was in effect prior to 2006 and this reach of stream had cooler temperatures at that time, the current data in Table 1 could be used for changes or modifications. The special regulation area could be shortened and redefined, eliminated, or remain as is until further social inputs are determined.

Russell Fork is managed as a put-take fishery. Rainbow trout are stocked at a rate of 750 fish \(/ \mathrm{mo}\) in April, May, and October. Based on the data collected (Table 2), this stream should continue with current management strategies. If any changes in production plans or reallocation of fish occur, November would be an acceptable month for an additional stocking.

\section*{Warmwater Stream Assessments}

One stream was sampled to examine species composition and length distribution of sportfish. Lotts Creek in Knott County was sampled on 11 June 2018 in one location via backpack electrofishing and seine hauls. Specific conductivity was 1,273 umhos/cm and prevented effective electrofishing. Total electrofishing time was 0.09 hours. Species composition is listed in Table 3 and sportfish length frequency distribution is in Table 4. The stream area sampled exhibited low fish species diversity, but good numbers of crayfish and hellgrammites and the possibility to offer anglers a small stream fishery for sportfish.

\section*{EASTERN FISHERY DISTRICT}

\section*{Project 3: Technical Guidance}

\section*{FINDINGS}

Details of the technical guidance provided during 2018 are shown in Table 1. Technical guidance was provided through three on-site visits. Additional technical guidance requests were handled over the telephone, walk-in visits, or by written correspondence. Topics encountered and responded to included: fish population balance, water quality problems, fish stocking, and aquatic vegetation problems.

Several other requests for information about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone, email, and walk-in visits.

Table 1. Pond technical guidance in the Eastern Fishery District during 2018.
\begin{tabular}{cllll}
\hline Date & County & Owner & Problem & Recommendations \\
\hline \(1 / 18\) & Harlan & Tony Edridge & weeds, fish stocking & grass carp,catfish stocking \\
\(2 / 21\) & Johnson & WildCat Pay Lake & filamentous algae & copper sulfate \\
\(3 / 26\) & Floyd & Greg May & pond stocking, new const. & stocking rates, pond book, stocking list \\
*4/20 & Harlan & HighSplint F\&G club & vegetation, stocking, habitat & fertilize \\
\(4 / 4\) & Law recce & Kevin Osborne & fish supplier info & supplier list, TG application \\
\(3 / 5\) & Johnson & Kevin Jervis & stocking info & fish supplier list, w ebb site links \\
\(4 / 16\) & Harlan & Roger Williams & stocking rates, algae control & pond book, suppliers list, herb recommendations \\
