# WESTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Sampling conditions for each survey event are listed in Table 1.

## Kentucky Lake

During the spring, 257 black bass were collected by diurnal electrofishing ( 120 PPS, DC current). However, it is important to note that we were only allowed to use one dipper due to safety protocols surrounding the ongoing COVID19 pandemic, so catch rates may not be directly comparable to previous years. During this sampling period, 244 largemouth bass ( 34.9 fish/hr) were collected from Blood River, Jonathan Creek, and Big Bear (Table 2). The catch rate (fish/hr) for largemouth bass was highest in Jonathan Creek ( $61.0 \mathrm{fish} / \mathrm{hr}$ ). Unlike previous years, Sugar Bay was not sampled. This was done in order to avoid interference with the ongoing snorkel surveys of the bass spawning habitat in that embayment.

For the first time, each bass collected during spring electrofishing was assessed visually for hook wounds. Overall $22 \%$ of the bass caught displayed a hook wound. It is also important to note that fishing tournaments were prohibited during the spring in order to prevent the spread of COVID19.

The spring bass data was used to complete the lake specific assessment (Table 3). The lake specific assessment suggests that the largemouth bass population rated "Poor". Growth was assessed this year using otoliths. The mean length of age- 3 largemouth at capture was 13.4 in (Table 3). The catch rate of age- 1 largemouth bass in the sample was low indicating a poor spawn in 2019. This was somewhat discouraging as we had high catch rates of age-0 largemouth in the fall of 2019. However, the mean length of those 2019 YOY bass was very low ( 3.9 in). Our habitat plan is focused on increasing recruitment of largemouth bass in the reservoir, and we are hopeful that improving habitat can help the bass population to recover.

The size structure parameters used to assess the fishery by standards set in the Kentucky Lake Fish Management Plan (KLFMP) showed a below-average catch of $<8.0$-in bass (Table 4). The catch rate of intermediate-size bass (12.0-14.9 in; 17.7 fish/hr) was slightly below the plan recommendation. The catch rate of harvestable-size bass ( $\geq 15.0 \mathrm{in}$ ) was also down from previous years' data, and below the plan recommendation. The catch rate of trophy-size largemouth bass ( $\geq 20.0 \mathrm{in}$ ) was also below the average for the last 10 years, and was below the KLFMP recommendation. The size distribution was again skewed heavily towards 12.0- to 14.9-in fish which was expected based on the strong spawn in 2016.

Proportional Size Distributions (PSD) values were calculated for black bass collected from each embayment sampled during the spring (Table 5). The average PSD and $\mathrm{RSD}_{15}$ values for largemouth bass were 85 and 26, respectively. These average values were used in the KLFMP assessment. The PSD value is above the assessment preferred range (55-75) due to the high proportion of fish over 12.0 in and the relatively weak year class of 2019 (Table 4). The $\operatorname{RSD}_{15}$ value was 26 , which also falls inside the targeted range ( $\mathrm{RSD}_{15}$ of 20-40).

During October, 581 black bass were collected by diurnal electrofishing ( 120 PPS, DC current) from four embayments; Blood River, Jonathan Creek, Big Bear, and Sugar Bay (Table 6). Largemouth bass comprised 67\% ( $104.0 \mathrm{fish} / \mathrm{hr}$ ) of this sample in Blood River and Jonathan Creek. This was a major improvement over the 2019 fall sample when the largemouth bass catch rate was 58.6 fish $/ \mathrm{hr}$. Smallmouth bass comprised $31.5 \%$ ( $49.1 \mathrm{fish} / \mathrm{hr}$ ) of the 2020 sample for those two embayments and actually outnumbered the largemouth in Blood River. However, based on length frequency it appears that the majority of those smallmouth were young-of-year.

Length and weight data were recorded from all bass collected during the fall sample to calculate relative weight values. The mean relative weight for harvestable-size largemouth bass was 96 (Table 7). This value was up from the 2019 estimated relative weight value of 93 , and is within the preferred range of $95-105$. The relative
weight of largemouth bass is one parameter that is being watched as an indicator of the effects of the population of silver and bighead carp in the lake. As silver and bighead carp numbers continue to increase, they could impact the plankton levels and hence the upper levels of the food chain.

Length-weight equations for black bass species at Kentucky Lake are:

$$
\begin{array}{ll}
\text { Largemouth bass } & \log _{10}(\text { weight })=-3.5003+3.17676 \times \log _{10}(\text { length }) \\
\text { Smallmouth bass } & \log _{10}(\text { weight })=-3.47340+3.11512 \times \log _{10}(\text { length })
\end{array}
$$

Otoliths were collected from a subsample of smallmouth bass < 10.0 in during fall sampling in 2020. Otoliths were used to age bass so that the catch rate and growth of age-0 fish could be evaluated. Otoliths were also collected from a subsample of largemouth bass in fall of 2020. When possible, at least 10 largemouth bass per inch class were collected, weighed, measured, and sexed, in addition to their otoliths being removed. Sex was determined visually by internal examination of the gonads. The catch rates of age- 0 smallmouth and largemouth bass during the fall sample were 39.8 and 76.7 fish $/ \mathrm{hr}$, respectively (Tables 8 and 9). The 2020 year class appears to be well above average, with average growth. The mean length of the age-0 largemouth bass was 5.3 in at time of capture in the fall. The age-length key from the full age sample was also used to assess the age frequency of largemouth bass >age-1. Few older fish were collected this fall, although the 2016 year class was still noticeable as a bump in 4 -year-old fish (Table 10). The low catch rates of older fish solidify the idea of very weak spawns in 2014 and 2015 (Table 10). Visible annuli on each otolith were measured using an ocular micrometer. The measurements were then used to backcalculate each fish's length at each annulus. Backcalculated lengths at age for all largemouth, all male largemouth, and all female largemouth are provided in Tables 11-13, respectively. Although the sample size of larger fish was small, the results suggest that female largemouth bass are showing higher lengths at age than their male counterparts (Tables 12 and 13).

Because of a string of several weak bass spawns, WFD started placing bass spawning habitat in Kentucky Lake and Lake Barkley prior to the bass spawn in spring 2019. Habitat consisted of shallow-water laydowns (sometimes referred to as spawning benches) and artificial spawning beds. Artificial beds are bowl-shaped structures that provide preferred substrate for bass. Our artificial beds were initially constructed with plastic sides but we have since changed to using all concrete. Habitat was placed at water elevations slightly below winter pool in areas that were perceived as lacking good habitat. Our goal is to provide sufficient habitat at lower water elevations because bass are often ready to spawn before water is high enough to reach good shoreline habitat in the spring. A reduction in competition for habitat resources should lead to higher individual nest success. To help determine how fish use these structures we conducted 11 weekly snorkel surveys from March 30 - June 8, 2020, at Sugar Bay on Kentucky Lake (Table 14). We rated the relative amount of observed eggs and fry at 67 sites and collected egg and fry samples to help with identification. An additional rating of "cleaned off" was added to track beds that had been brushed clean of debris but had no eggs or fry. Summary percentages of usage are in Tables 15 and 16.

In $2020,51 \%$ of the sites were used at least once by spawning bass including $13 \%$ of sites that were used twice by bass. Two thirds of artificial beds next to laydowns were used by bass, while artificial beds without laydowns were used at a rate of $47 \%$. The usage rates of laydowns without artificial nests were lower at $38 \%$. Once water temperatures started to warm up to about 70F, sunfish started to use our spawning habitat heavily. About $81 \%$ of our experimental habitat sites were used at least once by sunfish, and $96 \%$ of the artificial spawning beds were used by sunfish.

Across 53 artificial beds in Sugar Bay, we suspect 37 individual bass spawning events occurred based on weekly snorkel surveys. During the spawn of 2020 we had 269 artificial beds deployed in Kentucky Lake and 268 in Lake Barkley. If we expect similar results across both lakes, we can extrapolate those numbers and estimate that bass spawned 375 times on our beds in the spring of 2020. A typical bass nest may contain anywhere from 2,0007,000 fry after hatch (Post et al., 1998) meaning our artificial beds could have helped with the spawn of anywhere from about 750,000-2,600,000 bass fry. It is possible, however, that bass would have spawned in these areas even without any artificial spawning habitat. During snorkel surveys we never noted any natural beds away from our habitat but visibility often made that very difficult.

In order to further understand the timing and duration of the bass spawn, shoreline seining was conducted in Sugar Bay on June 15, 2020 and in Blood River on June 16, 2020. A 50 -foot seine with $1 / 4$-in mesh was used to
collect YOY largemouth bass until a total of 100 specimens were collected from each embayment. Smallmouth bass were also collected, but catches were much lower. Each bass was measured for total length in mm and the sagittal otoliths were removed. Otoliths were mounted convex side up using thermoplastic cement, sanded with 1200 grit sandpaper, and polished with 0.3 -micron alumina powder.

Each otolith was aged independently by two readers using a compound microscope at 100x-400x magnification. Reader agreement was typically within 1-3 days, but if the difference between readers was less than $10 \%$ of the fish's estimated age, the counts were averaged and accepted. To determine hatch dates we used the equation [(ordinal date collected)-(average ring count)-5)] (Dicenzo and Bettoli, 1995). To determine what dates bass were actually spawned on (when spawning activity took place on the nest), we used the equation [(hatch date)3] (Heidinger, 1976). The results of the hatch date and spawn date analysis are provided in Tables 17 and 18.

Differences in spawn dates between species and embayments were initially compared with an F-test for variances. Then, depending on equal or unequal variance, the spawn dates were compared using appropriate T-tests. In 2020, the average largemouth bass spawn date in Sugar Bay (April $24 \pm 1.7$ days) was significantly earlier than in Blood River (April $28 \pm 1.5$ days; $\mathrm{p}=0.004$ ). Although this is only one year, the mean length of age- 0 bass in October was 5.1 inches in Sugar Bay, and only 4.6 inches in Blood River, which supports the theory that earlier hatch dates correspond with larger mean lengths later in the year. The average smallmouth bass spawn date in Sugar Bay (April $13 \pm 2.5$ days) was not significantly different than in Blood River (April $15 \pm 6.9$ days; $\mathrm{p}=0.617$ ). However, when both embayments were combined, the average smallmouth bass spawn date (April $14 \pm 2.6$ days days) was significantly earlier than the average largemouth bass spawn date (April $26 \pm 1.1$ days; $\mathrm{p}=3.45 \mathrm{e}^{-14}$ ).

Trap nets were fished for crappie in Blood River and Jonathan Creek embayments for 80 net-nights (nn) during October and November. In addition, Ledbetter Bay was sampled for 40 nn . This is the fourth time Ledbetter Bay has been sampled for crappie. Otoliths were collected from a subsample of the entire population and used to assign ages and calculate mean lengths at age. The combined sampling effort yielded 931 crappie ( $7.8 \mathrm{fish} / \mathrm{nn}$ ), of which 3.3 fish/nn ( $42 \%$ ) were white crappie and 4.4 fish $/ \mathrm{nn}(58 \%)$ were black crappie (Table 19). The Blood River and Jonathan Creek data are listed as "sub-total" on this table and only data from these two embayments were used in the proceeding assessments. The total catch rate of crappie >age- 0 was 9.5 fish $/ \mathrm{nn}$ which is below the goal of 20.0 fish/nn set in the KLFMP (Table 20). The low total catch rate is a reflection of the weak spawns in 2016 and 2017. However, the catch rate of 7.7 fish/nn for age-1 crappie this fall was an encouraging sign of an above average spawn in 2019.

The number of crappie $\geq 8.0$ in and $\geq 10.0$ in collected in trap nets was 2.7 and 1.4 fish $/ \mathrm{nn}$, respectively (Table 20). The KLFMP objective for crappie is to maintain a catch rate of at least 10.0 fish $/ \mathrm{nn}$ for crappie $\geq 8.0$ in and $4.0 \mathrm{fish} / \mathrm{nn}$ for crappie $\geq 10.0 \mathrm{in}$. Neither objective was met this year.

Crappie at Kentucky Lake had above average growth rates in 2020. The growth management objective in the KLFMP is for age- 2 crappie collected in the fall to reach 9.5 inches in length. The average length of the age-2 crappie collected this year was 9.8 in (Table 20).

Another management objective in the KLFMP is to maintain a catch rate of age-1 crappie of at least 11.0 fish/nn (Table 20). The catch rate for this age group of crappie was 7.7 fish $/ \mathrm{nn}$. Although still below the management objective, this was the highest catch rate observed since 2015. For a discussion of the potential impacts of environmental factors on the spawn, please refer to the 2017 Annual Performance Report.

These parameters are also used as part of the calculation for ranking the crappie fishery at Kentucky Lake. Overall, the crappie population at Kentucky Lake rated "fair" this year (Table 21).

The fall trap netting data was used to calculate proportional size distributions and length-weight equations for crappie. PSD and $\mathrm{RSD}_{10}$ values are reported in Table 22.

The mean relative weights of keeper-size (>10.0 in) white crappie and black crappie were (101) and (97), respectively (Table 23). These relative weights are excellent and we have had several comments from anglers about the good health of the fish. This is in stark contrast to 2017 when skinny crappie were a major source of complaints and concerns. Relative weights for white and black crappie in 2017 were (89) and (85), respectively.

Length-weight equations for white and black crappie are listed below.

$$
\begin{array}{ll}
\text { White crappie } & \log _{10}(\text { weight })=-3.81796+3.51717 \times \log _{10} \text { (length) } \\
\text { Black crappie } & \log _{10}(\text { weight })=-3.69679+3.447 \times \log _{10} \text { (length) }
\end{array}
$$

Tables 24-29 list the back-calculated lengths at age for all white crappie, all male white crappie, all female white crappie, all black crappie, all male black crappie, and all female black crappie, respectively. Differences in growth rates between sexes were not obvious for either species. The age frequencies for white and black crappie collected are listed in Tables 30 and 31, respectively. The poor white crappie spawns reported in 2016 and 2017 are very noticeable as no 3 or 4-year-old white crappie were collected in 2020.

During the spring of 2020, icthyoplankton sampling was conducted in the Jonathan Creek embayment of Kentucky Lake. Weekly sampling began March 30, 2020 and ran through June 9, 2020. Samples were conducted using a rectangular neuston net with a 100 -micron mesh size, towed 50 feet behind a boat, at a speed of 1.5 mph . Tow duration was either 5 or 3 minutes depending on an a priori assessment of the expected concentration of icthyoplankton and leptodora to prevent clogging. A General Oceanics flowmeter was attached inside the mouth of the net to record the volume of water sampled during each run. Sampling began just after dusk and always followed the same site order. Each sampling event started closest to the main lake site and then progressed farther into the embayment (Appendix A).

Ichthyoplankton samples were preserved immediately in $95 \%$ ethanol and stored in mason jars. All larval fish were sorted and identified to the lowest practical taxon using "A Practical Key to Identify Families, Genera, and Species of Fish Larvae Commonly Collected in Tennessee Reservoirs" (Sammons, 1999), "Preliminary Guide to the Identification of Larval Fishes in the Tennessee River" (TVA, 1976), and "Early Development of Four Cyprinids Native to the Yangtze River, China" (Chapman, and Wang, 2006) (Bolu Yi, et al. 1988). Once identified, fish were counted and measured for total length. In cases of more than 100 individuals in a sample, a random subsample of at least 30 individuals was measured and used to extrapolate the lengths of the fish from the entire sample. Larval crappies were not identified to species due to overlapping myomere counts between both species and their hybrids (Spier and Ackerson, 2004).

The geometric mean and median of the 6 sample sites were used to evaluate overall densities during each week (Table 32). The standard error and coefficients of variation of the mean and geometric mean were used to evaluate sample accuracy. In 2015 the peak weekly density of crappie occurred on May $12^{\text {th }}$ and was 70.50 crappie $/ 1000 \mathrm{~m}^{3}$. In 2016 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was only 3.88 crappie $/ 1000 \mathrm{~m}^{3}$. In 2017 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was 31.99 crappie/ $1000 \mathrm{~m}^{3}$. In 2018 the peak weekly density of crappie occurred on May $19^{\text {th }}$ and was 27.74 crappie $/ 1000 \mathrm{~m}^{3}$. In 2019 the peak weekly density of crappie occurred on May $20^{\text {th }}$ and was 150.18 crappie/ $1000 \mathrm{~m}^{3}$. In 2020 the peak weekly density of crappie occurred on April $21^{\text {st }}$ and was 15.06 crappie/ $1000 \mathrm{~m}^{3}$ (Table 33). Based on these results, the crappie spawn in Jonathan Creek in 2020 appears to have been below average. This will still need to be verified by trap netting age-1 crappie in 2021. This year the peak weekly density of crappie occurred a full month ahead of when it typically occurs based on our sampling since 2015.

In order to determine the hatch dates of crappies more precisely, based on growth rates, all crappie that were $7-11 \mathrm{~mm}$ in total length were assumed to represent a one-week cohort (Table 33). Just like last year, crappie in this size range appeared to be fully recruited to the gear, and were best represented in the sample. It is possible that crappie shorter than 7 mm were not located in the pelagic sample sites yet, and that crappie over 11 mm were more likely to avoid capture. This length range was also chosen because a 7 mm crappie would grow to 11.1 mm in one week (our sample interval), based on a growth rate of 0.71 mm per day after swim up. This was our estimated daily growth rate from daily otolith ring counts of Jonathan Creek crappie collected later in the year (next section).

In addition to weekly cohorts, we also estimated daily cohorts of hatched crappie. All crappie that were captured outside of the $7-11 \mathrm{~mm}$ length range were excluded from the hatch date analysis to minimize the effects of gear bias and the longer exposure to natural mortality of older fish (Table 34). A hatch date was then backcalculated for each individual fish using the assumed growth rate ( $0.71 \mathrm{~mm} /$ day ) and the total length of each fish. A total length at hatch ( 4 mm ) was factored into the regression for hatch date. This technique has been employed in
other systems (Mitzner 1991). An incubation period of 95 hours (based on temperature) was also factored into the regression so that the day when fertilization occurred could be estimated.

The estimated hatching densities indicated that the spawn in Jonathan Creek lasted at least 54 days and extended at least until late May (Table 34). Because of our limited larval sampling window, we cannot be sure that crappie did not spawn before or after our sampling window. The literature reports most crappie spawns to be relatively short (1-2 months; Mitzner 1991 and Travnichek, et. al.1996). There does not appear to have been any strong peaks in spawning activity in 2020. The highest amount of spawning occurred around April 10 and the spawn stayed fairly steady at about half of that level until about May 7. Then there was almost three weeks of no crappie spawning activity until a small spawn on May 26. Similar to prior years' surveys, we found higher densities of larval crappie farther into the embayment (Table 32; Appendix A).

In June 2020 an effort was made to capture YOY crappie using a benthic otter trawl. Crappie were identified to species using dorsal fin counts, and a subsample of otoliths was collected from approximately 200 crappie for daily ring count analysis. The subsample was collected randomly without regard to crappie species or size. Crappie trawling has typically been conducted in the fall to assess year class strength. However, an earlier sample was necessary for accurate daily ring counts since those counts can become unreliable in fish $>100$ days old (Sweatman and Kohler, 1991). Trawling runs were conducted in Jonathan Creek because this is where the larval sampling occurred during the spring. To evaluate whether hatching periods and growth rates differed by embayment, trawling was also conducted at Blood River embayment. Otoliths were mounted convex side up using thermoplastic cement, sanded with 1200 grit sandpaper, and polished with 0.3 -micron alumina powder.

Each otolith was aged independently by two readers using a compound microscope at $100 \mathrm{x}-400 \mathrm{x}$ magnification. Reader agreement was typically within 1-5 days, but if the difference between readers was less than $10 \%$ of the fish's estimated age, the counts were averaged and accepted. In 2020, one fish was excluded based on reader disagreement. We were able to estimate an average daily growth rate for both species of crappie by using the equation described by Sweatman and Kohler (1991) [(total length mm-4mm)/\#days old-4 days]. This growth rate estimate was coupled with the larval data to provide an accurate estimate of crappie hatch dates in Jonathan Creek as described earlier (Table 34). There is no way to practically differentiate between crappie species in the larval samples. Thusly, the estimated growth rate used in the larval hatch date back calculation combined both species together. Our estimated growth rate of $0.71 \mathrm{~mm} /$ day was slightly higher than $0.67 \mathrm{~mm} /$ day from the past few years.

Because the collection of black crappie was so low ( $\mathrm{n}=5$ of 185 ; Table 35), both black and white crappie were combined when making comparisons across embayments. Differences in growth rates and hatch dates between embayments were initially compared with an F-test for variances. Then, depending on equal or unequal variance, comparisons were made using appropriate T-tests. In 2020, crappie in Blood River had a faster average growth rate $(0.81 \mathrm{~mm} /$ day $)$ than crappie in Johnathan Creek $\left(0.71 \mathrm{~mm} /\right.$ day; $\left.\mathrm{p}=5.58 \mathrm{e}^{-11}\right)$. Additionally, the average crappie hatch date in Johnathan Creek (May $2 \pm 2.2$ days) was significantly earlier than in Blood River (May $18 \pm 1.6$ days; $\mathrm{p}=4.71 \mathrm{e}^{-}$ ${ }^{25}$ ). The difference in hatch dates may be due to differences in embayment morphology or unknown temperature differences, and is consistent with prior years.

The catfish population was sampled at Kentucky Lake during June using low pulse (15 PPS) electrofishing along the main lake river channel. A chase boat was utilized to help collect catfish around the electrofishing boat. One dipper was used in each boat. A total of 114 catfish were collected during 58 electrofishing runs (Table 36). Each run lasted 300 seconds, for a total sample time of 4.83 hours over a three-day period. Of the samples, blue catfish had the highest catch rate at 13.3 fish $/ \mathrm{hr}$, and made up $63 \%$ of the catfish collected. The catch rate was much lower than observed in some previous years, but consistent with the last three years' results. Relative weight values are listed in Table 37. The relative weight values are all high, suggesting the fish are healthy.

Otoliths were collected from a subsample of blue catfish in 2019. That age data was used to calculate age frequencies. Age frequency data for blue catfish is presented in Table 38. This table should be used with caution as some length classes were missing from the 2019 age sample. Bumpiness around the catch-at-age curve suggests variable recruitment, but low conductivity seems to be depressing our catch rates in recent years making it difficult to draw conclusions.

## Lake Barkley

Black bass were collected during 7.5 hours of diurnal electrofishing ( 120 PPS, DC current) during the spring at sampling sites historically used on Lake Barkley. Because of covid-19 pandemic protocols at the time, only one dipper was used, making it difficult to fairly compare 2020 to historical data. A total of 168 black bass were collected at a rate of 22.4 fish $/ \mathrm{hr}$ (Table 39). Spotted and smallmouth bass combined for about $8 \%$ of the total black bass sampled. Catch rates were well below recent spring surveys and long term averages. At best, sampling yielded only fair results in a few embayments, while most locations had near record low catch rates. Although sampling during some years $(2011,2012$, and 2016) has been affected by weather conditions, this year was likely affected by unusual sampling restrictions due to Covid19 as well as some recent below-average spawns on Lake Barkley. Catch rates of age-1 fish following spawns in 2014, 2015, 2017, and 2018 have been poor and have likely reduced the overall numbers of bass in Lake Barkley when compared to long-term average catch rates. The 2019 largemouth bass spawn seemed promising due to the very high catch rate of age-0 fish in the fall last year ( $98.7 \mathrm{fish} / \mathrm{hr}$ ); however, these fish seem to have experienced high over-winter mortality and were only caught at a rate of 2.5 fish $/ \mathrm{hr}$ this spring. The long term average for age-1 largemouth in the spring is about 25.0 fish/hr. Even if some fish were missed because we only used one dipper, this is still well below average and indicates poor winter survival from the 2019 cohort. The small average size of the 2019 cohort last fall ( 4.1 in ) might help explain the poor survival The overall
largemouth bass catch rate was 20.7 fish $/ \mathrm{hr}$ which is the lowest spring catch rate on record since 1985 and falls well below the ten-year average of 60.9 fish $/ \mathrm{hr}$ (Table 40). Overall, $18 \%$ of sampled black bass had hook wounds, and these fish averaged 15.4 in.

The overall PSD and RSD $_{15}$ values for largemouth bass at Lake Barkley, along with values for individual embayments are listed in Table 41. The PSD value (90) is greater than the objective goal (PSD of 55-75) established in the Barkley Lake Fish Management Plan (BLFMP). This value indicates a bass fishery that is skewed towards larger fish. The $\operatorname{RSD}_{15}$ (54) was also greater than the set goal (20-40). The spring catch rates of small ( $\leq 8.0 \mathrm{in}$ ), medium (8.0-14.9 in), and larger ( $\geq 15.0 \mathrm{in}$ ) largemouth bass all remain lower than historical and 10-year averages (Table 40).

The lake specific assessment score for Lake Barkley was "Poor" (Table 42). The score was "Fair" or "Poor" for most of the last decade. Seasonal flooding as well as the occasional drought may have affected sampling in some years which in turn negatively influenced the assessment score. However, spring catch rates of most size classes of largemouth bass have been below average during this time as well. The fishery showed improvement in these ratings in 2017 and was rated as "Good". However, generally low catch rates overall have since negatively affected the score. We calculated age- 3 largemouth bass mean length at capture as outlined by Murphy and Willis (1996) in addition to the traditional method. This method uses a weighted average based on the age-length key and includes all sampled fish per age class. Although differences are slight, we do feel that this calculation more accurately describes this metric, as all spring-sampled bass are included in the calculation. The annual mortality of largemouth bass older than a year was $31 \%$ as determined using catch-curve regression of fall-caught largemouth (Table 42).

Black bass were sampled in October to collect length-weight data to assess condition factors and to determine the strength of the 2020 year-class. A total of 853 bass were collected from Little River, Eddy Creek, Willow Creek, and Demumbers Bay with about $72 \%$ being largemouth bass (Table 43). For historical comparisons, only data from Little River and Eddy Creek were used in the standardized population parameters of Lake Barkley bass. Largemouth bass were caught at a rate of 121.0 fish/hr which was just shy of 2019 (125.8 fish/hr) and about equal to the historical average going back to 2000. Well above average catch rates of small fish ( $<8.0 \mathrm{in}$ ) largely influenced overall catch rates. Catch rates of intermediate and large-sized largemouth bass were all below their respective 10 year averages. Relative weights were determined for all bass, but few adult smallmouth bass were collected (Table 44). Relative weights for all size groups of largemouth bass were good this year. The relative weight for harvestable-size ( $\geq 15.0 \mathrm{in}$ ) largemouth bass from Little River and Eddy Creek was 105 which is above the average for Lake Barkley and within the acceptable range. The length-weight equations for black bass at Lake Barkley are:

$$
\begin{aligned}
& \text { Largemouth BassLog }{ }_{10}(\text { weight })=-3.505+3.2141 x \log _{10}(\text { length }) \\
& \text { Smallmouth BassLog }{ }_{10} \text { (weight) }=-3.444+3.1121 x \log _{10} \text { (length) }
\end{aligned}
$$

During 2019, largemouth bass age and growth data was collected in the fall. This age and growth data was coupled with fall 2020 data to yield an estimate of the age distribution for largemouth bass. Catch rates for fallcaught fish by age-class are shown in Table 45. Ages ranged from 0-11 with age-0 being the most abundant.

Mean length of the age- 0 cohort of largemouth bass was 4.8 in (Table 46). This is below the historical average ( 5.3 in ) and shy of our $5.0-\mathrm{in}$ goal. It has been suggested that bass which reach at least 5.0 in by the fall will have a better chance of survival during their first winter. This year's total catch rate of age-0 largemouth bass from Little River and Eddy Creek ( 99.3 fish $/ \mathrm{hr}$ ) was the highest catch rate on record, while this year's catch rate of age-0 largemouth bass over 5.0 in ( $42.3 \mathrm{fish} / \mathrm{hr}$ ) was the fourth highest catch rate since 2001 . This year we again collected age- 0 length and catch data on smallmouth bass. Mean length of the age- 0 cohort of smallmouth bass was 4.5 in (Table 47). Total catch rate ( 42.5 fish $/ \mathrm{hr}$ ) and the catch rate of age- 0 smallmouth bass over 5.0 in ( 13.8 fish $/ \mathrm{hr}$ ) were both higher than fall 2019.

Trap nets were fished for crappie in Little River and Donaldson Creek embayments for 80 net-nights (nn) during October and November. A total of 1056 crappie were collected at a rate of 13.2 fish/nn (Table 48). Additionally, Crooked Creek (LBL) and Eddy Bay were sampled for another 80 net-nights. Crooked Creek ( 6.6
fish $/ \mathrm{nn}$ ) and Eddy Bay ( 11.2 fish $/ \mathrm{nn}$ ) both provided reasonable samples, and will remain on the sampling schedule in the future if possible.

White crappie accounted for $79 \%$ of the total catch, and were caught at 8.8 fish $/ \mathrm{nn}$. Black crappie accounted for the remaining $21 \%$ of the total catch, and were collected at a rate of $2.3 \mathrm{fish} / \mathrm{nn}$ (Table 48). The proportion of black crappie collected in Little River (8\%) was less than half of all other embayments. The mean relative weights for keeper-size ( $>10.0 \mathrm{in}$ ) black and white crappie were 101 and 104, respectively (Table 49). For historical comparisons, only data from Little River and Donaldson Creek were used in the standardized population parameters of Lake Barkley crappie in Table 50. The catch rate of harvestable-size ( $\geq 10.0 \mathrm{in}$ ) crappie was 0.4 fish $/ \mathrm{nn}$, which is lower than the ten-year average of 1.4 fish $/ \mathrm{nn}$. The catch rate of quality-size ( $\geq 8.0$ in) crappie was $1.8 \mathrm{fish} / \mathrm{nn}$, which is below the management objective ( $4.0 \mathrm{fish} / \mathrm{nn}$ ) set in the BLFMP. The catch rate of age- 1 crappie ( $3.1 \mathrm{fish} / \mathrm{nn}$ ) was also below the management objective ( $5.0 \mathrm{fish} / \mathrm{nn}$ ).

The length-weight equations of white and black crappie from Lake Barkley are:

$$
\begin{array}{ll}
\text { White crappie } & \log _{10}(\text { weight })=-3.616+3.2975 \times \log _{10}(\text { length }) \\
\text { Black crappie } & \log _{10}(\text { weight })=-3.456+3.1837 \times \log _{10}(\text { length })
\end{array}
$$

Crappie collected in trap nets in Little River and Donaldson Creek were used to determine stock densities. The PSD (49) of white crappie was higher than last year but still below the historic average of 57 , while the $\mathrm{RSD}_{10}$ (10) of white crappie was similar to last year but still below the historic average of 28 . These metrics suggest a somewhat balanced size distribution of white crappie that is missing some larger fish (Table 51). The PSD (43) of black crappie was higher than last year but still below the historic average of 55 , while the $\operatorname{RSD}_{10}$ (12) of black crappie was lower than last year and still below the historic average of 20. These metrics also suggest a somewhat balanced size distribution of black crappie that is missing some larger fish.

Otoliths from 529 crappie were used for age and growth analysis. Ages ranged from 0-5 years for white crappie and 0-3 years for black crappie (Tables 52 and 53). Growth continues to be good as crappie generally reached 10.0 in between age 1 and 2 at capture. There did not appear to be any major differences in growth patterns between male and female white crappie (Tables 54 and 55) or black crappie (Tables 56 and 57). The average lengths of age- 2 white crappie and black crappie at capture were 10.7 and 10.4 in, respectively (Table 50). In addition, we calculated age- 2 crappie mean length at capture as outlined by Murphy and Willis (1996) for all years presented in Table 50. This method uses a weighted average based on the age-length key and includes all sampled fish per age class. Although differences are slight, we do feel that this calculation more accurately describes this metric, as all crappie are included in the calculation.

Age frequencies were estimated by combining catch data with age data. $76 \%$ of white crappies captured in Little River and Donaldson Creek were age-0 fish while age-1 fish made up another $22 \%$ of the catch (Table 58). Few white crappies older than age- 2 were collected, suggesting that fish from the relatively strong spawns in 2014 and 2015 are finishing their life cycles followed by below average spawns in 2016, 2017, and 2019, and an average spawn in 2018. The black crappie catch in Little River and Donaldson Creek was also dominated by age-0 fish (Table 59). Very few black crappie were older than age-1, suggesting that fish from the relatively strong spawns in 2014 and 2015 are finishing their life cycles followed by below average to average spawns in 2016-2019. Similar to largemouth bass, high age- 0 catch rates of white and black crappie in fall 2019 were not represented well in 2020 as catch rates of age- 1 crappie were below the long-term averages for both species. The age- 0 white crappie catch rate was well above the long-term average in 2020, while the age-0 catch rate of black crappie was about equal to the long-term average. This preliminary age- 0 data suggests that 2020 could have been a decent crappie spawn.

Assessment of the crappie population yielded a rating of "Fair" at Lake Barkley in 2020 (Table 60). The catch of age- 1 crappie was below the 10-year average; however, catches of age- 0 fish were above average. The catch rate of crappie $\geq 8.0$ in and the average length of age- 2 crappie both rebounded a bit from 2019 and are closer to 10 -year averages. As expected, the population of larger fish dropped in 2020, due to combined effects of mortality of the stronger 2014 and 2015 year classes and in response to the weaker 2016 and 2017 year classes. We are hopeful to see more large fish in the next couple of years following a decent spawn in 2018 and what appears to potentially be a decent spawn in 2020.

The catfish population was sampled along the main lake river channel at Lake Barkley in June and July with low-pulse ( 15 PPS) electrofishing while utilizing a chase boat to collect fish further away from the electrofishing boat. One dipper was positioned in each boat for a total of two dippers at all times. A total of 486 catfish were collected during 46 electrofishing runs (Table 61). Each run lasted 300 seconds, for a total sample time of 3.83 hours over a three-day period. Blue catfish had the highest catch rate at $118.3 \mathrm{fish} / \mathrm{hr}$, and made up $93 \%$ of the catfish collected. Flathead catfish and channel catfish are likely underrepresented using this method as these fish were often observed, but were much harder to approach and dip than blue catfish. Relative weight values were all within or greater than ideal values of 95-105, with the exception of flathead catfish 20.0-29.9 in., and are listed in Table 62.

Otoliths from 135 blue catfish were extracted and analyzed in 2019. Age data from blue catfish collected in 2019 was used to calculate an age frequency for the population (Table 63). Of the blue catfish, $61 \%$ of the sample consisted of age 1-3 fish.

## Kentucky Lake Creel Survey

A random, non-uniform probability, roving creel survey was conducted on the Kentucky portion ( 51,000 a) of Kentucky Lake from 13 March to 30 November 2020. The Kentucky portion of the lake was divided into ten creel areas (Appendix B). The survey was conducted six hours per day, with the goal of 5 days per week. However, the initial technician quit and was replaced by a technician who was also a full time student. This resulted in fewer overall sample days than normal, but was still adequate for statistical comparison. One hour each day was randomly chosen to conduct an angler count. The remaining five hours was dedicated to creeling anglers actively fishing. The overall temporal sampling scheme was twenty days per month, consisting of six weekend days and fourteen weekdays. Varying time period probabilities were assigned to each month. Higher geographic probabilities, resulting in more frequent interviews, were assigned to the Blood River and Jonathan Creek areas from March through May, and October and November, than were assigned to the other six areas. Equal probabilities were assigned to all areas from June to September. An angler attitude questionnaire concerning fishing on Kentucky Lake was conducted by the creel clerk throughout the survey period (Appendix C).

During the 2020 creel, the typical angler was a male ( $87 \%$ ) resident ( $73 \%$ ) who was casting ( $45 \%$ ) or still fishing ( $35 \%$ ) from a boat ( $85 \%$; Table 64). There was a much higher percentage of resident anglers than normal in 2020, which could be attributed to the Covid19 travel restrictions enacted by Kentucky and other states. Of the crappie anglers, $66 \%$ used a spider rig (defined as 3 or more poles per angler) for fishing. The average fishing trip for all anglers was 4.21 hours. The number of trips declined to 146,711 in 2020. This is the lowest number of trips ever recorded in a Kentucky Lake creel survey, but it is impossible to attribute this to poor interest from anglers or to the effects of Covid19 restrictions. It may also be important to note that fishing tournaments were prohibited during the spring and early summer to help prevent the spread of Covid19. Length frequencies of all harvested or released fish are given in Table 65.

Table 66 provides fish catch and harvest statistics for the 2020 creel survey. Crappie anglers accounted for $23 \%$ of fishing trips to Kentucky Lake in 2020 ( $33 \%$ in 2017, $33 \%$ in 2015 and $24 \%$ in 2011). Estimated catch and harvest rates for crappie were slightly below average. Crappie anglers caught ( $0.77 \mathrm{fish} / \mathrm{hr}$ ) which is below the longterm average of ( $1.08 \mathrm{fish} / \mathrm{hr}$ ). However, of the crappie caught, $72 \%$ were harvested (Table 67). This higher proportion of legal size crappie corresponds to fall trap netting data that suggested good year classes in 2014 and 2015 and poor year classes in 2016 and 2017. Fifty-two percent of the crappie were caught in April and May (Table 68). As part of our efforts to evaluate harvest by method, crappie anglers were recorded as using the following methods: casting, still fishing ( $1-2$ poles), spider rigging ( 3 poles), spider rigging ( $4-5$ poles), and spider rigging ( $>5$ poles). During this survey, $66 \%$ of crappie anglers used 3 or more poles. The percentage of crappie anglers using ( $>5$ poles) increased to $26 \%$ in 2017 compared to only $15 \%$ of crappie anglers in 2015 (Table 69). However, the percentage of anglers using ( $>5$ poles) stayed around $25 \%$ again in 2020. There is an ongoing trend in crappie fishing right now to use only 1 or two poles in conjunction with advanced live-imaging sonar to target individual
fish. In the future this may cause a trend towards fewer poles, but ultimately higher catch rates which will be tough to regulate with the use of reduced bag limits and impossible to regulate with pole limits.

Black bass anglers accounted for $36 \%$ of all fishing trips to Kentucky Lake during 2020 (Table 66). There were 53,022 black bass fishing trips in the 2020 creel. During older surveys, any bass that was currently in the livewell was recorded as harvested. However, during recent surveys, anglers with bass in the livewell were asked if they intended to release them at the end of the day. In all cases, tournament anglers indicated that they intended to release their fish after the weigh-in. Additionally some non-tournament anglers simply chose to keep fish in the livewell for photographic or "mock tournament" purposes, but indicated that they would release them at the end of the day. As a comparison with previous surveys, bass kept in livewells by anglers were reported as harvested, even though they would be released at the end of the day. The harvest rate, which included tournament bass and "mock tournament" bass, was estimated to be 0.06 bass per hour for anglers actually targeting bass (Table 70). However, when tournament and "mock tournament" harvested bass were removed from the actual harvest, the harvest rate dropped to 0.013 bass $/ \mathrm{hr}$. Largemouth bass accounted for $87 \%$ of the harvested black bass by number (Table 71).

About $15 \%$ of all trips were taken to catch panfish during 2020 (Table 66). In 2017, only $6 \%$ of the trips taken targeted panfish. However, despite higher efforts the catch and harvest rates were below the long-term average. Almost 55\% of the panfish were harvested during May (Table 72). Bluegill and redear sunfish accounted for $100 \%$ of the panfish harvested. Of the bluegill, only $52 \%$ of the fish caught were harvested, while $81 \%$ of the redear sunfish caught were harvested (Table 73).

Catfish anglers accounted for $14 \%$ of all fishing trips on Kentucky Lake in 2020 (Table 66). The number of trips for catfish was well above the long-term average, despite low numbers of fishing trips overall. The catfish fishery remains highly harvest oriented. Almost $70 \%$ of the catfish caught were harvested (Table 74). Higher numbers of catfish caught were reported in May (Table 74). These were likely anglers targeting channel catfish in the embayments. The total catch of channel catfish was almost six times higher than the catch of blue catfish (Table 75).

Less than $1 \%$ of the anglers fishing Kentucky Lake during 2020 sought Morones (Table 66). This group includes; white bass, yellow bass, striped bass and hybrids. However, it is likely that most anglers were fishing for white or yellow bass. In 2018, 100,000 striped bass were stocked in the lake and there are some anglers who target them at certain times of the year. However, positive ID on this genus is difficult for anglers and was more difficult for the creel clerk during this year due to the social distancing requirements of the Covid19 pandemic. Approximately $70 \%$ of the Morones caught were yellow bass, with white bass making up $28 \%$. Almost $75 \%$ of yellow bass were released after being caught (Table 77). Similar to the prior survey in 2017, the highest catch rates of Morones occurred during April and June when no anglers reported they were targeting Morones (Table 76).

An angler attitude survey was also given to anglers willing to participate (Appendix C). Results for the anglers opinions on the black bass fishing were encouraging with only $15 \%$ of anglers reporting that they were somewhat or very dissatisfied. Most anglers were not in favor of pole limits for crappie or catfish. Consistent with prior surveys, only $55 \%$ of anglers stated they knew that Asian carp were widely considered to be a good fish to eat. Additionally, only $65 \%$ of anglers were aware that commercial fishing for Asian carp was occurring on Kentucky Lake. There was also a section of questions directed at tournament anglers. Although the sample size was low $(\mathrm{n}=13), 100 \%$ of the tournament anglers interviewed said they would be in favor of a free tournament permit system.

## Lake Beshear

Largemouth bass were collected by diurnal electrofishing (120 PPS, DC current) during April at Lake Beshear. As with all of our spring electrofishing, these results should be used with caution as we were only able to use one dipper. Ninety-seven largemouth bass were collected at a rate of 38.8 fish $/ \mathrm{hr}$ (Table 78). The catch rate of harvestable-size ( $\geq 12.0 \mathrm{in}$ ) largemouth bass was 28.0 fish/hr (Table 79). This year's sample falls below the objective in the Lake Beshear Fish Management Plan (LBFMP) to maintain a catch rate of at least $45.0 \mathrm{fish} / \mathrm{hr}$ for harvestable-size largemouth bass. The catch of age-1 fish was low this year ( $3.2 \mathrm{fish} / \mathrm{hr}$ ), but low recruitment is typical in Lake Beshear. Other objectives are to maintain high catch rates of bass $\geq 15.0$ and $\geq 20.0$ in. Ideally, these catch rates should be greater than 30.0 and $3.0 \mathrm{fish} / \mathrm{hr}$, respectively. The catch rates per hour for these length groups
of bass were 24.8 and 4.8 , respectively. Lake Beshear continues to have a quality bass fishery with good numbers of bass $\geq 15.0$ in. However, the lower catch of bass $<12.0$ in this spring is a potential concern for the future. The fishery rated as "Fair" in 2020 (Table 80).

Largemouth bass were collected by diurnal electrofishing (120 PPS, DC current) in October (Table 78). The catch rate ( $124.0 \mathrm{fish} / \mathrm{hr}$ ) was an improvement over last year, but again the catch was skewed towards smaller fish. Relative weight data (Table 81) suggests that larger bass ( $\geq 15.0 \mathrm{in}$ ) are healthy with regard to their lengthweight ratio. The average relative weight value was 100 for these larger bass and 83 for all sizes of bass. The length-weight equation for largemouth bass at Lake Beshear is:

$$
\log _{10}(\text { weight })=-3.55334+3.18177 \times \log _{10}(\text { length })
$$

Otoliths were removed from a subsample of largemouth bass $\leq 10.0$ in to determine the mean fall length of the age- 0 cohort, and determine their catch rate. The catch rate for age- 0 largemouth bass was $60.8 \mathrm{fish} / \mathrm{hr}$ (Table 82). The average length of an age- 0 bass was 5.1 in .

## Lake Pennyrile

Electrofishing for all species of sportfish at Lake Pennyrile was conducted on April 24, 2020. Because of Covid19 pandemic protocols at the time, only one dipper was used, making it difficult to fairly compare 2020 to historical data. One-hundred-and-fourteen largemouth bass were captured at a rate of 114.0 fish $/ \mathrm{hr}$ (Table 83). This catch rate is above the 10 -year average of 99.6 fish/hr (Table 84 ). The majority of largemouth bass were still below 12.0 in . Only 4 ( $3.5 \%$ ) bass were 12.0 in or larger, while only $1(0.9 \%)$ bass was over 15.0 in from this year's sample. The catch rate of fish $\geq 15.0$ in ( $1.0 \mathrm{fish} / \mathrm{hr}$ ) is below the 10 -year average of 2.2 fish $/ \mathrm{hr}$ (Table 84). The catch rate of largemouth bass 8.0-11.9 in was 75.0 fish $/ \mathrm{hr}$ which is almost equal to the management objective of 80.0 fish/hr. A high catch rate of intermediate-size largemouth bass is desirable in order to maintain good numbers of large sunfish in this system.

The catch rate of large-size ( $\geq 8.0 \mathrm{in}$ ) bluegill was below average at $8.0 \mathrm{fish} / \mathrm{hr}$. (Table 85 ). The catch rate of large-size ( $\geq 8.0 \mathrm{in}$ ) redear was also below average at 10.0 fish $/ \mathrm{hr}$. Catch rates of large bluegill and redear were much higher in 2015-2018 than they were in 2019-2020. Overall catch rates for most species rebounded from lows in 2019. We will continue to monitor Lake Pennyrile in 2021 to see if catches of larger panfish improve.

PSD and RSD values for largemouth bass, bluegill and redear sunfish are listed in Table 86. The PSD value for largemouth bass (5) suggests a population heavily skewed toward small bass. The largemouth bass fishery is likely stunted which is our goal when managing for large panfish. PSD's and RSD's were about average for bluegill in 2020 and suggest a more balanced size distribution. PSD's and RSD's were below average for redear in 2020 and suggest a size distribution skewed towards more small fish.

In 2019, a small sample of bass from Lake Pennyrile were aged using otoliths. Age data collected in 2019 was coupled with our 2020 sample to calculate an age frequency for the population. Bass ranged from 1-7 years old, and most fish were age-1 (Table 87). The largemouth bass population was rated as "Fair" in 2020 (Table 88). This is a slight improvement from "Poor" in 2019 but due to the shift in management focus towards trophy sunfish, it is unlikely that the largemouth bass population will be rated highly again soon.

## Lake George

Electrofishing for all species of sportfish was conducted at Lake George (Marion, KY, Crittenden Co.) on May 14, 2020. Because of Covid19 pandemic protocols at the time, only one dipper was used. This survey was the first electrofishing survey at Lake George since 1994. Sixty-nine largemouth bass were captured at a rate of $69.0 \mathrm{fish} / \mathrm{hr}$ (Table 89). Intermediate ( $12.0-14.9 \mathrm{in} ; 22.0 \mathrm{fish} / \mathrm{hr}$ ) and large ( $\geq 15.0 \mathrm{in} ; 31.0 \mathrm{fish} / \mathrm{hr}$ ) fish made up the majority of the sample (Table 90). The PSD (90) and $\operatorname{RSD}_{15}$ (53; Table 91) values for largemouth bass suggest an unbalanced
population skewed towards more large fish. Catch rates for fish $>18.0$ in (18.0 fish/hr) and $>20.0$ in ( 9.0 fish $/ \mathrm{hr}$ ) were also quite high.

The catch rate of bluegill was 176.0 fish/hr (Table 89). The PSD (30) of bluegill suggests an unbalanced population skewed towards small fish (Table 91). The catch rate of redear sunfish was 81.0 fish $/ \mathrm{hr}$ (Table 89). The PSD (50) and $\mathrm{RSD}_{9}$ (23) values for redear suggest a fairly balanced size distribution (Table 91). The catch rate of white crappie was 40.0 fish/hr (Table 89). The PSD (15) and $\mathrm{RSD}_{10}$ (3) values for white crappie suggest an unbalanced population skewed towards small fish (Table 91). The catch rate of channel catfish was 35.0 fish $/ \mathrm{hr}$ (Table 89). The PSD (89) value for channel catfish suggests an unbalanced size distribution skewed towards more large fish (Table 91).

In 2020, a small subsample of white crappie from Lake George was aged using otoliths. Crappie ranged from 3-8 years old and most fish were age-5 (Table 92). Relatively few white crappie greater than 7.0 in were observed indicating that most fish in the population stunt at that size.

Appendix A. 2020 Larval fish sample sites in Jonathan Creek embayment, Kentucky Lake

Appendix B. Kentucky Lake Creel Survey Areas 2020.

## Appendix C. KENTUCKY LAKE ANGLER ATTITUDE SURVEY 2020

1. Have you been surveyed this year? Yes - stop survey No - continue
2. Name $\qquad$ (Optional) and Zip Code $\qquad$
3. How many times do you fish Kentucky Lake each year? $\mathrm{N}=133$

First time here $7.5 \% \quad 1$ to $421.64 \% \quad 5-10$ 20.9\% More than 10 49.25\%
4. Which species of fish do you fish for at Kentucky Lake (check all that applies)? $\mathrm{N}=134$

Redear $5.22 \%$ Bluegill $35.07 \%$ Black Bass 58.96\% Crappie 48.52\% Cattish 48.51\% White bass 3.73\% Yellow bass
1.49\% Other- Asian carp 0.0\%; Striped bass, Sauger, Anything each 0.0\%
5. Which one species do you fish for most at Kentucky Lake (check only one)? N=134

Redear 2.24\% Bluegill 10.45\% Black Bass 38.06\% Crappie 20.15\% Catfish $29.1 \%$ White bass 0.0\% Yellow bass 0.0\% Other- Anything 0.0\%

## Answer the following questions for each species you fish for - (see question 4)

## Redear Anglers

6. In general, what level of satisfaction or dissatisfaction do you have with redear fishing at Kentucky Lake? $\mathrm{N}=6$ Very satisfied $33.3 \%$ Somewhat satisfied $33.3 \%$ Neutral $33.3 \%$ Somewhat dissatisfied $0.0 \%$ Very dissatisfied 0.0\%

6a. If you responded with somewhat or very dissatisfied in question (6) - what is the single most important reason for your dissatisfaction? $\mathrm{N}=0$
Number of fish $0.0 \%$ Size of fish $0.0 \%$ Not happy with regulations $0.0 \%$ Don't know how to catch them $0.0 \%$

## Bluegill Anglers

7. In general, what level of satisfaction or dissatisfaction do you have with the bluegill fishing at Kentucky Lake? $\mathrm{N}=46$ Very satisfied 2.1\% Somewhat satisfied 32.6\% Neutral 36.9\% Somewhat dissatisfied 28.2\% Very dissatisfied $0.0 \%$
7a. If you responded with somewhat or very dissatisfied in question (7) - what is the single most important reason for your dissatisfaction? $\mathrm{N}=13$ Number of fish $15.3 \%$ Size of fish $76.9 \% \quad$ Not happy with regulations $0.0 \%$ Other reason "size and number" 7.6\%

## Black Bass Anglers

8. In general, what level of satisfaction or dissatisfaction do you have with the black bass fishing at Kentucky Lake? N=78 Very satisfied $6.4 \%$ Somewhat satisfied $57.6 \% \quad$ Neutral $20.5 \% \quad$ Somewhat dissatisfied $14.1 \%$ Very dissatisfied 1.2\%

8a. If you responded with somewhat or very dissatisfied in question (8) - what is the single most important reason for your dissatisfaction? $\mathrm{N}=12$

Number of fish $66.6 \% \quad$ Size of fish $16.6 \% \quad$ Not happy with regulations $0.0 \%$ Other- "size and number" $8.3 \%$
"cant catch them from the bank" 8.3\%

## Crappie Anglers

9. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Kentucky Lake? $\mathrm{N}=60$ Very satisfied $8.3 \%$ Somewhat satisfied $51.6 \% \quad$ Neutral $11.6 \%$ Somewhat dissatisfied 26.6\% Very dissatisfied $1.6 \%$

9a. If you responded with somewhat or very dissatisfied in question (9) - what is the single most important reason for your dissatisfaction? $\mathrm{N}=17$

Number of fish $82.3 \%$ Size of fish $5.8 \% \quad$ Not happy with regulations $5.8 \%$ Other- "water levels" $5.8 \%$

## Catfish Anglers

10. In general, what level of satisfaction or dissatisfaction do you have with the catfish fishing at Kentucky Lake? N=62 Very satisfied $30.6 \% \quad$ Somewhat satisfied $48.3 \% \quad$ Neutral 16.1\% Somewhat dissatisfied 4.8\%
Very dissatisfied 0.0\%
10a. If you responded with somewhat or very dissatisfied in question (10) - what is the single most important reason for your dissatisfaction? $\mathrm{N}=0$
Number of fish $0.0 \%$ Size of fish $0.0 \%$ Not happy with regulations $0.0 \%$ Too much commercial fishing $0.0 \%$

## White Bass Anglers

11. In general, what level of satisfaction or dissatisfaction do you have with the white bass fishing at Kentucky Lake? $\mathrm{N}=5$ Very satisfied 20.0\% Somewhat satisfied 40.0\% Neutral 20.0\% Somewhat dissatisfied 20.0\%
Very dissatisfied 0.0\%
11a. If you responded with somewhat or very dissatisfied in question (11) - what is the single most important reason for your dissatisfaction? $\mathrm{N}=1$
Number of fish $100.0 \%$ Size of fish $0.0 \%$ Not happy with regulations $0.0 \%$ Other- $0.0 \%$

## All Anglers

12. Are you satisfied with the current size and creel limits on all sport fish at Kentucky Lake? N=130 Yes 98.4\% No $1.5 \%$ 12a. If you responded "No" to Question 11, which species are you dissatisfied with and what size and creel limits would you prefer? Creel Limit (CL), Length Limit (LL), Slot Limit (SL)

Crappie - "increase crappie limit"
Bass - Largemouth 19" LL, Smallmouth 19" LL,
13. Are you aware that the Kentucky Department of Fish and Wildlife creates and maintains shallow water stakebeds marked with white poles, and deepwater brushpiles marked with white buoys as fish attractors in Kentucky Lake? N=132
Yes 68.9\% No 31.1\%
13a. When you fish Kentucky Lake, how regularly do you fish around Department placed fish attractors? $\mathrm{N}=126$
Always 1.6\% Frequently 21.4\% Occasionally 28.6\% Rarely 21.4\% Never 27.0\%
13b. If you answered "Rarely" or "Never", what is the single most important reason you don't fish around Department placed fish attractors? $\mathrm{N}=52$
Over fished 7.7\% No boat 34.6\% No success 7.7\% Don't know their location 0.0\% Wrong water depth 0.0\% Fishes own stuff 7.7\% Boat too big 0.0\% Get snagged 0.0\% Other- "no reason" 7.7" ; "didnt know" $5.8 \%$; "fishes open water" $5.7 \%$; "first time" $3.8 \%$;
14. If you fish for crappie, do you spider rig (three or more poles per angler at the same time) as your primary method of crappie fishing? $\mathrm{N}=61$
Yes 36.1\% No 64\%\%
14a. If "Yes", how many poles do you use? $\mathrm{N}=22$ 3 18.1\% 4 31.8\% 5 22.7\% 6 18.2\% $>6$ 9.0\%
15. Do you support or oppose a pole limit while fishing for crappie? N=60 Support 28.3\% Oppose 50.0\% No Opinion 21.6\%

15a. If you support a pole limit, what should be the pole limit per person? $\quad \mathrm{N}=17$
$10.0 \% \quad 211.8 \% \quad 329.4 \% \quad 423.6 \% \quad 511.8 \% \quad 611.8 \% \quad>6$ 11.8\%
16. If you fish for catfish, do you fish with multiple poles at the same time? $\mathrm{N}=64$ Yes $78.1 \% \quad$ No $21.9 \%$

16a. If "Yes", how many poles do you use? $\mathrm{N}=50 \quad \begin{array}{lllllllllllllll}2 & 54.0 \% & 3 & 24.0 \% & 4 & 12.0 \% & 5 & 4.0 \% & 6 & 2.0 \% & >6\end{array}$ 4.0\%
17. Do you support or oppose a pole limit while fishing for catfish? N $=64$ Support $35.9 \%$ Oppose $59.3 \%$ No Opinion $4.6 \%$

17a. If you support a pole limit, what should be the pole limit per person? $\mathrm{N}=23$
$14.3 \% \quad 2 \quad 30.4 \% \quad 3 \quad 30.4 \% \quad 4 \quad 26.1 \% \quad 5 \quad 0.0 \% \quad>5 \quad 8.7 \%$
18. If you fish for catfish in Kentucky Lake, which is more important to you: catching trophy fish, or catching more keeper size fish to eat? $N=64$

Trophy fish 7.8\% Catching keeper fish to eat 76.5\% Both equally important 6.2\% No opinion 9.4\%
19. Have you participated in an organized fishing tournament on any body of water within the last twelve months? $\mathrm{N}=134$ Yes 9.7\% No 90.3\%

19a. Were any of the tournaments an alternative format (catch, photo, release; onboard weighing, etc.)? $\mathrm{N}=13$
Yes 7.8\% No 92.3\%
19b. KDFWR is interested in learning more about the number of fishing tournaments in Kentucky. Would you support or oppose a regulation requiring fishing tournaments to register for a free permit that required upcoming tournaments and their ramp locations to be available on the KDFWR website and also required tournaments to report their fishing effort and catch? $\mathrm{N}=13$

Support $100 \%$ Oppose $0.0 \%$ No opinion $0.0 \%$
20. Are you aware that Asian carps are generally considered to be an excellent fish to eat? $\mathrm{N}=134$ ?

Yes 55.2\% No 44.78\%
21. Are you aware that commercial harvest of Asian carps occurs on Kentucky Lake? N=134

## Yes 65.67\% No 26.12\%

21a. How often do you see commercial fishermen fishing for Asian carps on Kentucky Lake? N=98
Always 1.1\% Frequently 3.1\% Occasionally 23.5\% Rarely 29.6\% Never 31.6\% Not aware 0.0\%

21b. How are your typical interactions with commercial fishermen fishing for Asian carps? $\mathrm{N}=65$

$$
\text { Positive } 26.2 \% \quad \text { Negative } 1.5 \% \text { No opinion } 56.9 \%

Data from 1985 to 2010 is listed in previous annual reports.
Assessment quartiles were updated in 2015, previous years' APR's will list rating based on old assessment ranges.
** age and growth data was not collected this year, therefore used previous age data set estimates.
2011* and 2013* samples were hampered by high water levels during flooding, sample was later than normal; overall a poor sample and not all embayments were sampled.
2012* sample was hampered by low water levels during drought.
*** mortality rates were calculated from fall caught and aged fish.
****Mean length calculated using a weighted average applied to the entire sample
Rating
5-7 = Poor (P)
8-11 = Fair (F)
12-16 = Good (G)
17-20 $=$ Excellent $(E)$

[^0]wfdwragk.d20

Table 14. Lake conditions and spawning activity rating for each survey site during snorkel surveys in Sugar Bay, 2020. WFD laydowns were placed by KDFWR staff and Natural laydowns were pre-existing laydowns that were monitored. Rating $0-5$ was based on relative density of observed eggs or fry, $\mathrm{c}=$ cleaned off (bed brushed clean of debris), blank=not found/not searched for. LMB=largemouth bass, SMB=smallmouth bass, BASS=undetermined black bass, $\mathrm{SF}=$ sunfish, UNK=unknown species.

Table 17. Estimated hatch dates of largemouth bass in Sugar Bay and Blood River at Kentucky Lake, derived using daily ring counts of juveniles in 2020. "\# hatch" represents the time when bass actually hatched on the nest. "\#spawned" represents the estimated time when eggs were fertilized. Elevation (mean feet above sea level) and mean daily discharge (cubic feet/second) at Kentucky Dam also provided. Daily mean temperature readings (1 meter below surface) taken at Hancock Biological Station in main channel. Environmental variables were provided by TVA and Murray State University.

Table 18. Estimated hatch dates of smallmouth bass in Sugar Bay and Blood River at Kentucky Lake, derived using daily ring counts of juveniles in 2020. "\# hatch" represents the time when bass actually hatched on the nest. "\#spawned" represents the estimated time when eggs were fertilized. Elevation (mean feet above sea level) and mean daily discharge (cubic feet/second) at Kentucky Dam also provided.
Temperature readings (1 meter below surface) taken at Hancock Biological Station in main channel. Environmental variables were provided by TVA and Murray State University.

Table 34. Estimated crappie hatch dates in Jonathan Creek, derived using larval fish lengths back calculated using a growth rate derived from the daily ring counts of juveniles in 2020. Hatch dates from Jonathan Creek and Blood River derived solely from daily ring counts of juveniles also provided. "\# hatch" represents the time when crappie actually hatched on the nest. "\#spawned" represents the estimated time when crappie eggs were fertilized. Elevation (mean feet above sea level) and mean daily discharge (cubic feet/second) at Kentucky Dam also provided. Temperature readings (1 meter below surface) taken at Hancock Biological Station in main channel. Environmental variables were provided by TVA and Murray State University.

# NORTHWESTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Table 1 presents a summary of conditions encountered while sampling at state-owned or managed lakes and ACOE reservoirs during the 2020 field season.

## Nolin River Lake

## Black Bass Sampling

For various reasons black bass have not been surveyed since fall of 2017. Black bass were unable to be surveyed during spring 2020 due to high water conditions throughout the sampling window. However, diurnal boat electrofishing to survey the black bass population at Nolin River Lake was conducted on October 13, 2020 (Tables 2 and 3). CPUE and relative weights are lower than last collected in 2017, but are not alarming at this point with few recent data points. Complete data collection efforts will be attempted in 2021 (spring/fall samples, age/growth samples).

## Crappie Sampling

The crappie population was not directly assessed in 2020. It is scheduled to be surveyed during fall 2021.

## White Bass Sampling

Gill netting to assess the white bass population was conducted in November (Tables 4-8). CPUE is within range of previous collections; although, it would have been above average if not for poor sampling conditions lower lake on the last two days of sampling. Catch rate for age- 1 fish is among the highest collected, indicating above average recruitment of the 2019 year class. Recruitment is highly variable at Nolin due to dynamic spring water conditions but catch rate for age-0 fish also indicates a successful 2020 spawn. Mean length at age- $2+$ decreased slightly from recent collections. Utilization remains low outside of the spring spawning run (reference Table 18 for creel statistics) as we regularly capture fish ages 5-7. Relative weights are over 100 for each length group and improved from the 2015 survey. The white bass population at Nolin River Lake is stable and performing well, as usual.

## Walleye Sampling

Two attempts were made to collect walleye via diurnal electrofishing in the headwaters during March 2020. Water was very high and made for dynamic and inefficient sampling conditions. On March 9, Northwest Fishery District (NWFD) staff put in at Bacon Creek and worked upstream with one boat. We collected thirteen male and one female walleye on this trip. On March 17, the Southwest Fishery District (SWFD) brought their jet boat to assist. SWFD sampled the Nolin River Lake tailwater while NWFD sampled along the face of the dam within the lake. Neither crew collected walleye on these trips. Next, both crews put in at Bacon Creek. SWFD ran upstream approximately 14 miles to the mouth of Roundstone Creek and sampled downstream, capturing a handful of male walleye. NWFD sampled upstream from Bacon Creek approximately seven miles, capturing six male walleye.

Walleye were sampled concurrently with white bass using 150-foot experimental gill nets (Tables 9-13) in November 2020. A total of 54 walleye were collected for a CPUE of 6.0 fish $/ \mathrm{nn}$. Table 9 provides length frequency and CPUE for the past 14 fall samples. With CPUE remaining relatively consistent and low, effort could be increased in order to increase catch, but will result in the sacrifice of many more white bass. Mean length at ages 1-3 increased from the 2015 survey. Relative weights are consistent with previous collections (Table 12). The walleye population at Nolin River Lake continues to be below average and is subject to further evaluation and discussion on future management moving forward.

## Channel Catfish Sampling

Data was recorded for each catfish collected during white bass/walleye sampling in November (Tables 14 and 15). All metrics are very similar to previous collections and show no cause for concern.

## Dissolved Oxygen - Temperature Profiles

Profiles were completed July 7, 2020 (Table 29) to document water temperature and dissolved oxygen levels at Nolin River Lake. Profiles were conducted at five sites (Dam (site 1), State Park (site 2), Long Fall Creek (site 3), Big Island (site 4), and Barton Run (site 5)) along the main channel of the lake. As expected, profiles are very different throughout the lake with the best water conditions found upper lake.

Profiles have been conducted intermittently since 2011. Recent interest in following the walleye population and associated water quality parameters will require profiles to be taken at more regular intervals moving forward. Plans for 2021 include taking profiles during June, July, August, and September.

## Creel Survey

A random, stratified, roving, creel survey scheduled for 16 days per month was conducted at Nolin River Lake from April 01 to October 31, 2020 to estimate angling pressure and angler catch/harvest statistics (Tables 16-28). Due to lake conditions, the survey did not begin until April 08, 2020.

For survey purposes the lake was divided into an upper and lower section with one section being surveyed per day (6-hour time period) during either a morning or afternoon time period. Each section (upper and lower) was further divided into three equal subsections that the clerk spends an equal amount of time in ( 2 hours), while interviewing and progressively counting anglers in each. Creel interviews and angler attitude surveys were collected using an iPad with GPS capability in 2020, which allowed for the collection of coordinates associated with each interview (Figures 1 and 2). Figure 1 provides points of reference for each angler creel interview conducted in $2020(\mathrm{~N}=$ 2,148).

Table 16 provides summary statistics from the four most recent creel surveys conducted at Nolin. Estimated angler pressure was a 20-year high while angler catch and harvest statistics are all time highs (1991-2020). The number of fishing trips showed a significant increase from the 2015 and 2008 creels but was lower than the 2004 survey. In 2020, anglers expended an estimated 197,265 hours fishing at Nolin River Lake. This is an increase of 44,315 hours from the 2015 survey. In 2020, anglers caught an estimated 648,323 fish, an incredible increase of 492,739 from the 2015 survey, and harvested an estimated 188,625 fish, almost three times the estimated 64,205 fish harvested in 2015. The majority of increases can likely be attributed to Covid19. The USACE retracted launch fees for the year and many people were either out of work or "working from home" which afforded more time to fish! It is worth noting that fishing pressure, catch and harvest all increased, indicating that the extra time on the water resulted in success.

When ranked by preference, anglers expended an estimated 103,411 man-hours pursuing black bass, 45,785 hours for crappie, 18,592 hours for panfish, 12,204 hours for "anything", 7,595 hours for catfish, 5,453 for walleye, and 4,226 hours for white bass in 2020. The order of group preference remains very similar to previous surveys. The panfish group did bump up two spots in 2020 from the 2015 creel, which was ranked; black bass, crappie, "anything", catfish, panfish, walleye, and white bass. However, it lines up well with the 2008 survey, which ordered the groups; black bass, crappie, panfish, "anything", walleye, white bass, and catfish.

The white bass fishery continues to receive limited pressure outside of the spring spawning run. We will attempt to improve utilization of the fishery. We plan to pursue several avenues to raise awareness and participation, including, but not limited to, working with local guides, Marketing Division, I\&E Division, USACE, and Nolin Lake State Park.

Black bass harvest statistics used in the creel summary included all tournament-caught livewell fish as harvested. While we know these fish were supposedly released after weigh-in, there is a certain amount of mortality that can be
expected. We chose to include those fish as harvested in order to overestimate rather than underestimate harvest. If tournament-caught fish in livewells are tallied as released, and none estimated as lost to delayed mortality, the annual harvest rate for black bass is right at $1.0 \%$. When including all tournament livewell fish as harvested the estimated annual harvest rate is $4.89 \%$.

Figure 1. Distribution of creel interviews at Nolin River Lake in 2020 ( $\mathbf{N}=\mathbf{2 , 1 4 8}$ ). Several interviews did not generate an accurate GPS location and were not included on the map.

An Angler Attitude (AA) Survey was conducted during the creel survey to gather angler preference and satisfaction and data (Figures 2 and 3). A total of 250 angler attitude surveys were completed in 2020. Those survey points are visually represented in Figure 2. Each respondent was first asked for his or her home zip code. Ninety-seven percent of respondents were Kentucky residents; the remaining $2.8 \%$ provided home zip codes from four other states. In general, the percentage of anglers who target bass most frequently has decreased a little, while those targeting crappie, walleye, white bass, and flathead catfish have all increased from 2008 and 2015 surveys. The largest increase is found in flathead catfish anglers. In 2008, there were no anglers primarily targeting flatheads. In 2015, there were a few $(0.7 \%, \mathrm{~N}=2)$ and in $2020,12.4 \%(\mathrm{~N}=30)$ of anglers who completed an Angler Attitude Survey fished for flathead catfish more than any other species at Nolin. Bass and crappie anglers had overwhelmingly positive outlooks on the fisheries. The few who responded negatively cited the same reasons for dissatisfaction as many anglers who claim to be satisfied. Walleye anglers $(\mathrm{N}=44)$ are, understandably, mostly somewhat dissatisfied or neutral ( $40.9 \%$ and $34.1 \%$, respectively). The primary reason for dissatisfaction is number of fish available. Walleye anglers primarily fish March through November with a higher frequency of responses indicating they fish in the fall. However, this AA survey did not catch folks during the early spring walleye fishery in the headwater. It is possible that some of the same anglers were interviewed later in the year but that is unknown. Additionally, live
bait and casting were cited as the two most often used fishing tactics ( $36.4 \%$ and $31.8 \%$, respectively). Trolling ( $18.2 \%$ ) and jigging under lights ( $11.4 \%$ ) were the next two most frequently utilized methods. All white bass anglers interviewed were either very or somewhat satisfied with the fishery. Number of fish and size of fish were cited as the two most important reasons for their satisfaction.

All interviewed anglers were asked questions 8, 9, and 11 through 15 (Figure 3). Approximately $66 \%$ of anglers fish Nolin River Lake more than ten times per year. There were no first time anglers interviewed for the AA survey. Only $61.5 \%$ of respondents owned a smart phone, and, of those, $92 \%$ regularly use it as a fishing tool. Question 10 is vague as it leaves the definition of fishing tool open to interpretation. Affirmative responses could include things such as using their smartphone to check the weather, using a mobile app such as Navionics for navigation or depth charts, or using the KDFWR website to find fish habitat structures, among other things. The purpose of this questions was to see how many of our anglers could potentially benefit from, or be reached, via the publication of a KDFWR fishing and boating mobile app. Seventy-nine percent of respondents stated they were aware that KDFWR places fish habitat structures within the lake and $98.5 \%$ indicated they fished the structures in the past. The majority of interviewees stated they found the locations of the structures while the lake was at winter pool ( $60.8 \%$ ), while $24.7 \%$ found the locations on the KDFWR website. Almost all respondents felt the addition of structure had improved their fishing success and $71.6 \%$ were aware the structure locations were available on our website.

Figure 2. Distribution of angler attitude surveys at Nolin River Lake in 2020 ( $\mathbf{N}=\mathbf{2 5 0}$ ). Several interviews did not generate an accurate GPS location and were not included on the map.

15. Are you aware the locations of all KDFWR placed attractors/structures are available on our website? $(\mathrm{N}=197)$ Yes 71.6\% No 28.4\%

Figure 3. Results of the $\mathbf{2 0 2 0}$ Nolin River Lake angler attitude survey ( $\mathbf{N}=\mathbf{2 5 0}$ ).

## Rough River Lake

## Black bass Sampling

The black bass population was not directly assessed in 2020. It is scheduled to be surveyed during spring and fall 2021.

## Hybrid Striped Bass Sampling

Gill netting to assess the hybrid striped bass population was conducted during November (Tables 30-34). Northwestern Fisheries District staff fished sampling nets on the South Fork and the Urban Fisheries Research Section fished sampling nets on the North Fork. A total of 405 hybrids were collected in 11 net-nights ( 36.8 fish $/ \mathrm{nn}$ ) over the three-day sampling period.

Catch rates in 2020 rebounded from lows seen in 2019 (Table 34) and fall within the range of previous samples. On average, body condition decreases with size (Table 31). In 2020, relative weight for 8.0- to 11.9-in fish was a little lower than what has been seen over the past 8-9 years. There is nothing to be alarmed about at the moment but we will continue to keep an eye on that in future samples to make sure it rebounds. There has been an abundance of forage available year-round over the past decade, which should produce high relative weights for the larger fish ( $\geq$ 15.0 in ) which are feeding exclusively on shad. Since that is not the case, it leads us to hypothesize that poor water quality conditions (temperature and dissolved oxygen) leads to enough stress during the summer months to reduce foraging to the point that fish are losing weight. Stress due to high temperature and low D.O. will affect larger fish to a greater extent. As water quality improves in the early fall, fish resume feeding and gain back some, but not all, of the weight lost during the stressful period. The extent of the poor water quality is evident when Temp/D.O. profile data is color coded (Tables 37-39). We know that fish are being caught during the summer months, and that fish are being caught below, or at least in the bottom of, the thermocline. This tells us that fish are actively selecting cooler water over higher dissolved oxygen concentrations. The amount of time spent in cooler water is unknown but it seems fish are moving up and down throughout the water column multiple times a day. Data from the telemetry project may shed some light on this hypothesis, because the acoustic tags included temperature sensors. The data is in the process of being analyzed and will be reported when complete.

The mean length at age $2+$ at capture increased slightly from 2019 and remains within the expected range (Table 34). Growth remains a bit variable, but is similar to previous collections (Table 32). We routinely collect old fish, between ages 7-11 during sampling events; however, these fish make up a small proportion of the catch. It is interesting that we do not see fish over eight pounds with any frequency given the longevity of life for some of these fish. This also supports the hypothesis that water quality is keeping fish from reaching their maximum growth potential.

Gill netting as part of the project to detect differences in survival and growth rate of reciprocal and original crosses was completed in 2020. The research showed no significant difference in performance of the two crosses at early ages. NWFD will continue to monitor growth and longevity of the crosses through regularly scheduled standard sampling and alternative data collection methods (angler caught fish, short net sets while trap netting). Reciprocal cross hybrid striped bass will be stocked moving forward until data shows a need for change.

In response to frequent angler complaints about not being able to find or catch fish during the summer months, a radio telemetry project was initiated in 2018 to determine summer locations and movement patterns. Hybrid striped bass were collected for tagging via electrofishing from the upper lake/river area (Eveleigh to Adkins Camp boat ramps). Forty hybrid striped bass from 15.8-22.3 in were surgically implanted with VEMCO V13T transmitters ( $13 \times 43 \mathrm{~mm}, 12.0 \mathrm{~g}$ air). Twelve VEMCO VR2W receivers were deployed throughout the lake on May 11, 2018. Eleven of twelve receivers were removed from the lake in November 2020. The remaining receiver is missing in action. Data is still being analyzed and will be reported when complete.

The hybrid striped bass population continues to be relatively stable and thriving despite increased catch/harvest and poor summer water quality. Based on the statewide assessment, the hybrid population rebounded from 2019 to go back to an "Excellent" rating.

## Channel Catfish Sampling

Gill netting to assess the channel catfish population was conducted concurrently with hybrid striped bass sampling (Tables 35 and 36). A total of 61 channel catfish were collected over 11 net-nights for a CPUE of 5.6 fish per netnight (Table 35). Catch rate and length distribution is similar to previous collections. Weights were recorded for each catfish sampled and indicate condition (Wr) is good and similar to previous collections (Table 36).

## Dissolved Oxygen - Temperature Profiles

Dissolved oxygen and temperature profiles were conducted June - August in 2020 (Tables 37-39) to document seasonal changes in water temperature and dissolved oxygen levels throughout the water column. Profiles were conducted at four to six sites (upper, middle, and lower South Fork, the dam, and middle and lower North Fork) along the main channel of the lake. Profiles are color coded by water quality category taken from Kilpatrick 2003 (M.S. thesis, Virginia Tech). Blue indicates "Optimal" conditions where water temperature is between 70.7 and $77.9^{\circ} \mathrm{F}$ and dissolved oxygen is $\geq 4.5 \mathrm{ppm}$. Green indicates "Sub-optimal" condition where water temperature is $<$ 70.7 or between 77.9 and $80.6^{\circ} \mathrm{F}$ and dissolved oxygen is between 2.0 and 4.4 ppm . Orange indicates "Poor" conditions where water temperature is greater than $80.6^{\circ} \mathrm{F}$ and dissolved oxygen is less than 2.0 ppm .

Profiles have been conducted since 2013 as part of ongoing projects documenting survival and growth of stocked original and reciprocal hybrid striped bass, and documenting seasonal movement and habitat use with radio telemetry equipment. Profiles are highly variable relative to weather and water conditions. Historically, June profiles show some amount of sub-optimal conditions, July profiles show the entire water column is "poor" habitat, August is highly variable and can provide either some or zero "sub-optimal" habitat, and September has generally rebounded to hold some of each category. There seems to be little doubt fish are significantly stressed during July/August of each year. Usually, we consider $2.0 \mathrm{mg} / \mathrm{L} \mathrm{O}_{2}$ to be the cutoff for sustained fish activity, but we know anglers are catching fish at depths with less than $2.0 \mathrm{mg} / \mathrm{L} \mathrm{O}_{2}$. Biologists in North Carolina are finding the same thing with hybrid striped bass in Lake Norman. Fish are actively seeking cooler water temperature with low dissolved oxygen during summer months when water temperatures are high. However, creel data shows that Rough River Lake anglers continue to fish for and catch fish during that period, although average size of fish harvested is less than 15.0 in . Again, once telemetry data analysis is complete, it should help us see how much time is being spent at depths with poor water quality.

## Lake Malone

## Largemouth Bass Sampling

Largemouth bass sampling was not conducted at Lake Malone during spring 2020 but was completed during October (Tables 40 and 41). A total of 503 largemouth bass were collected during 2.5 hours of diurnal electrofishing, yielding a CPUE of 201.2 fish/hr. Relative weights for each length group were slightly lower than previous collections (Table 41). Bass will be sampled both spring and fall 2021 to document catch rates, length distributions, relative weights and age and growth statistics.

## Dissolved Oxygen - Temperature Profile

Dissolved oxygen and temperature profiles were conducted September 12, 2020. Profiles were conducted midchannel in three locations (above Shady Cliff Bridge, where the two main arms of the lake converge, and near the spillway tower; Table 42). A dissolved oxygen concentrations greater than $2.0 \mathrm{mg} / \mathrm{L}$ was present to a depth of approximately 9 feet at sites 1 and 2 and down to 11 feet at site 3 .

## Mauzy Lake

## Largemouth Bass Sampling

Sampling to evaluate the largemouth bass population was conducted in May 2020 (Tables 43-46). Total catch rate was the highest of record, with the majority of fish in the 8.0- to 11.9-in range. Catch rate for fish $\geq 15.0$ and $\geq 20.0$ in was down compared to recent samples, especially for fish over 15.0 in . Good numbers of fish in the 12.0- to 14.9in range should lead to an increase of fish greater than 15.0 inches in 2021. Despite lower catch rates for larger size classes, other increases led to Mauzy receiving a "Good" to "Excellent" rating based on the statewide assessment.

Recently, excessive aquatic vegetation (coontail) spread throughout the lake and impeded sampling efforts, fertilization efforts, and public fishing opportunity. Attempts to limit growth using herbicide and fertilization was unsuccessful in 2020. Grass carp will be stocked during spring 2021 and herbicide will be applied as necessary to
keep the boat ramp and bank fishing access areas relatively clear. Fertilization will not be attempted initially in 2021 due to poor success in 2020. If aquatic vegetation can be maintained at reasonable levels it may be attempted mid 2021 or spring 2022.

## Bluegill/Redear Sunfish Sampling

Electrofishing to assess the bluegill and redear sunfish populations was not conducted in 2020. It will be completed in 2021.

## Lake Renovation Plans

Across all species, growth continues to decline or remain constant at undesirable levels. Additionally, there are numerous undesirable species present in the lake (gizzard shad, crappie spp., flathead catfish, spotted gar, etc.). Ultimately, Mauzy Lake would benefit from another, more complete, renovation. Plans to dredge and deepen extensive shallow areas, upgrade existing bank fishing access, install fish habitat, lime the lake basin, renovate the fishery, and construct a headwater wetland are being created. Mauzy Lake is wholly contained within a WMA and renovation efforts can easily be accomplished.

## Carpenter Lake

## Largemouth Bass

Largemouth bass were sampled at Carpenter Lake in April and October 2020 (Tables 41, 44, and 47-50). Catch rates were very similar to the year prior (2019) but below the long-term average for each length group except fish $\geq 15.0$ in. We continue to see a great catch rate for fish $\geq 15.0$ in, which should translate to more fish $\geq 20.0$ inches in 2021. Body condition collected in the fall is within the range established in previous samples. The bass population at Carpenter is relatively stable and performing as expected; however, we will continue to monitor the bass population annually.

## Bluegill/Redear Sunfish Sampling

Electrofishing to assess the bluegill and redear sunfish populations was conducted in May (Tables 51-54). Total catch rate for bluegill was the highest of record and was seen across all length groups. For the first time since 2014, we collected one bluegill greater than 8.0 in . This is likely the result of abundant gizzard shad and submerged aquatic vegetation.

Seventy-four redear sunfish were collected in May in conjunction with bluegill sampling. Total catch rate is near the record high from 2019. The most notable change is the increase in catch rate for $\geq 8.0$-in fish, which can be attributed to growth of the 6.0- to 7.9-in fish from 2019. Redear sunfish less than 3.0 in have not been collected since 2010. This is a result of sampling inefficiencies rather than lack of reproduction as evidenced by annual collection of 3.0 - to 5.9 -in fish. We did not collect any fish > 10.0 inches in 2020 but anglers report catching some quality fish.

Gizzard shad are likely negatively affecting the bluegill and redear sunfish populations. After two failed shad eradication efforts, saugeye were stocked at 85 fish/acre in May 2019 and 100 fish/acre in 2020. These stockings are an attempt to reduce the gizzard shad and crappie populations and increase bass predation on the bluegill. Increased predation on the bluegill should positively affect their growth and produce bluegill greater than 8.0 inches in the future. A third saugeye stocking is scheduled for 2021 at 100 fish/acre. Anglers report catching a few saugeye throughout the year but very few are seen during standard sampling events. Nighttime electrofishing was attempted in November 2020 but no saugeye were seen. Several attempts will be made to collect data in 2021.

## New Kingfisher Lakes

## Largemouth Bass

Electrofishing to assess the largemouth bass population at New Kingfisher Lake was conducted in April and October (Tables 41, 44, 56-59). Spring catch rate more than doubled from 2020 to 2021. The length frequency distribution is now more consistent and shows signs of successful recruitment. Advanced largemouth bass fingerlings were stocked in fall $2019(1,600)$ to help fill in the gaps and kick start the population. Catch rates for fish greater than 15.0 in and greater than 20.0 in remain high and the largemouth bass fishery should continue to grow over the next few years as multiple year classes develop and stabilize. Fall sampling produced fish in good condition and with a consistent length distribution. Overall, based on the statewide assessment, New Kingfisher looks and scores "Excellent". Sampling to monitor the development of the bass population will continue in the spring and fall of 2021.

## Bluegill/Redear Sunfish Sampling

The sunfish population was sampled via electrofishing in May (Tables 53, 60-62). Total bluegill CPUE is similar to that seen in 2019 but lower than 2017-2018. This is probably closer to where we want to be for growth rates to continue to improve. As the largemouth bass population continues to balance out and stabilize, it is hoped the bluegill numbers will follow suit. Only fifteen redear sunfish were collected in 2020 and, of those, several were 8.09.0 in .

Total sunfish CPUE does not account for the presence of green sunfish and warmouth, which are prolific throughout the rock-lined shoreline. A shoreline rotenone treatment was conducted in summer 2019 in an attempt to reduce undesirable sunfish. Another shoreline rotenone application may be attempted in summer 2021 pending spring sampling results. Gizzard shad were documented in both spring and fall samples. The bluegill population will be monitored to ensure adequate growth and size structure develops. If not, shad control methods (winter rotenone treatments and/or saugeye stocking) will be employed.

## Old Kingfisher Lake

## Largemouth Bass

Electrofishing to assess the largemouth bass population was conducted at Old Kingfisher Lake in April and October (Tables 41, 44, 63-66). A total of 51 bass were collected in April ranging from 4.3 to 19.3 in. Catch rate for fish less than 8.0 in increased significantly, while catch rate for fish $\geq 15.0$ and $\geq 20.0$ in both declined. Total CPUE nearly doubled from 2019 to 2020; however, when dealing with low collection numbers it only takes not collecting a few fish to make a significant impact on catch rate. Fall sampling revealed that fish were in good condition, with the fish over 15.0 in looking exceptional. Sampling is planned for spring and fall 2021. Age and growth data will be collected in a few years once the bass population expands and stabilizes.

## Bluegill/Redear Sunfish Sampling

The sunfish population at Old Kingfisher Lake was sampled via electrofishing in May (Tables 53, 67-69). Total bluegill CPUE was 874.7 fish/hr, which is roughly half way between 2018 and 2019 total CPUE. Catch rate for each length group increased from 2019 findings. The size structure is slightly improved from 2019. Total numbers remain above the desired range but are still shifting around as the bass population changes as well. There is an abundance of green sunfish and warmouth residing amongst the shoreline riprap. A shoreline rotenone treatment was conducted along the riprap of both Kingfisher lakes in 2019. A second shoreline rotenone will be conducted in 2021 if the number of green sunfish and warmouth increase or remain similar. As the largemouth bass population grows and stabilizes, sunfish growth and size structure will improve. Age-growth data will be collected after populations have stabilized.

Gizzard shad were documented at both Old and New Kingfisher lakes in 2018. Given the high productivity of the Kingfisher lakes, it is likely the shad populations will expand quickly. They will be monitored along with the sunfish
to determine if shad control strategies need to be employed. Two potential options for controlling shad are winter shad eradications and saugeye stocking.

## Washburn Lake

## Largemouth Bass

Electrofishing to assess the largemouth bass population was conducted at Washburn Lake in April and October (Tables 41, 44, 70-73). Total CPUE ( $266.7 \mathrm{fish} / \mathrm{hr}$ ) is the lowest seen in about a decade and below the long-term average ( 346.5 fish/hr). Fish 12.0-20.0 in were noticeably missing. Good numbers of 8.0- to $11.9-\mathrm{in}$ and 12.0 - to 14.9-in fish seen in 2019 did not show up in the larger length groups in spring or fall samples in 2020. In general, it is unclear where these fish have went. We are hopeful that sampling during 2021 will shed some light on the situation.

## Bluegill/Redear Sunfish Sampling

The sunfish population at Washburn Lake was sampled via electrofishing in May (Tables 53, 74-77). Again, nearly equal numbers of bluegill and redear sunfish were collected in 2020 as they were in 2018. However, total catch rate for both species was half of the total catch rates observed in 2018. Catch rates for each length group declined for both species. Some of the decline can likely be attributed to effective aquatic vegetation management. Grass carp were stocked at 3 fish/acre, and herbicide treatments were conducted in 2018. Beginning in 2019, Pond Pro powdered fertilizer (10-52-4) became the standard use product and multiple applications are made annually. The combination of all strategies has kept aquatic vegetation to a minimum for both 2019 and 2020, and now affords the opportunity to deploy more fish habitat structures that will not be covered up by SAV.

## Channel Catfish Sampling

Channel catfish were sampled on two occasions during October using tandem hoop nets (Table 78). Three tandem sets ( 3 nets each) were baited with Zote soap and fished for two nights. A total of 52 channel catfish were collected during the first sampling event. While processing the catch from the first survey, the adipose fin of each fish was clipped upon release. During the second sample, a total of 42 channel catfish were collected, with 13 of those being recaptures from the previous sample. Using the Lincoln-Peterson Index for mark-recapture population estimate we come up with a population estimate of 168 channel catfish. The time period between samples was approximately two weeks which limited the chances of fish being removed from the sample population through mortality or harvest. Fish were not aged this year. Channel catfish were last stocked in 2019. Washburn was removed from the stocker list for 2020 and moving forward. Eight channel catfish spawning boxes were installed during May 2020. Boxes were checked for use June 26 using a GoPro camera. We were unable to locate one of the boxes, it is believed to have been deployed deeper than planned and settled into the soft substrate. That box will be searched for and repositioned in 2021. Additionally, two boxes had eggs but no adults present, three boxes had eggs and an adult present, one box had an adult present but no eggs, and the last box was inconclusive due to visibility. We will continue to monitor the catfish population via hoop nets and fin clips to document natural reproduction and recruitment.

Washburn Lake needs another renovation. Plans to dredge and deepen extensive shallow areas, create more bank fishing access, install fish habitat, lime the lake, renovate the fishery, create a headwater wetland, and replace the existing water control structure have been created. The current water control tower leaks profusely and could fail at any time, requiring plans to be in place to move forward with a renovation when necessary. This renovation will require more planning, cooperation, and financial commitment than the renovation at Mauzy due to the proximity of private landowners and county roads serving as two of the lake boundaries. The feasibility of surveying and marking the property boundary will be explored further in 2021.

# SOUTHWESTERN FISHERY DISTRICT 

## Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Lake sampling conditions are summarized in Table 1.

## Barren River Lake (10,000 acres)

## Black Bass

Spring black bass were not sampled due to high water levels (10- to 20-ft above summer pool) and Covid19 restrictions.

Fall young of year sampling (Tables 2 and 3) suggests a moderate 2020 year-class. Age-0 CPUE ( $244.0 \mathrm{fish} / \mathrm{hr}$; Table 3) was the second highest catch rate recorded over the past 10 years despite a later sampling date. Age-0 CPUE $\geq 5.0$ in ( 32.7 fish/hr) was slightly lower than the average from the past 10 years. Age-0 largemouth bass mean length ( 3.8 in ) was one of the lowest recorded in the past 10 years; again despite a later sampling date. Age-0 largemouth bass production and growth was highest in the upper reaches of lake arms (Walnut and Beaver creeks.). Poorer growth and numbers characterized the lower ends of the lake (Peter Creek and the Peninsula sites). Largemouth bass made up the majority of the fall sample ( $95 \%$ ), while spotted bass made up $5 \%$ of the sample (Table 2). Smallmouth bass were nearly nonexistent in these samples.

## Hybrid Striped Bass

Gillnet sampling for hybrids in mid-September and early December yielded a very good catch rate ( 21.9 fish $/ \mathrm{nn}$ ) overall, with mostly larger ( $\geq 13.0 \mathrm{in}$ ) sizes represented (Table 4). The earlier sample collected a smaller size range, while the later sample was dominated by larger fish. The double stocking rate ( $\mathrm{n}=400,000$ ) year classes of 2014, 2016 and 2018 (age- $2+$, 4+ and 6+) have performed well in the fishery; however, the similarly-stocked 2015 year class did not perform as well (Tables 5 and 6). The assessment rating for the fishery dipped to "Good" due to a decrease in the growth rate (which returned to previous levels) and the catch rate of age-1 fish ( 1.6 fish/nn). Larger-sized fish were in better condition ( $\mathrm{Wr}=92$; Table 7) compared to the 2017 sample ( $\mathrm{Wr}=88$ ) and were closer to the average relative weights (mid- to upper-90's) from prior years. The length-weight equation for hybrid striped bass ( $\mathrm{n}=175$ ) was:

$$
\log _{10}(\text { weight })=-5.0888+3.0841 * \log _{10}(\text { Length })
$$

## Green River Lake (8,210 Acres)

Late-winter muskie sampling and spring bass sampling were circumvented by high water levels ( $\geq 5$ - ft above summer pool until late-April) and Covid19 restrictions

## Black Bass

Fall YOY sampling (Tables 9 and 10) suggests a "moderate" largemouth bass 2020 year class. Age-0 CPUE $\geq 5.0$ in ( $19.7 \mathrm{fish} / \mathrm{hr}$ ) was similar to the average over the last 10 years, with a weaker showing of age- 0 fish in the lower reaches (Lone Valley and Ramp 1) of each lake arm. The higher overall catch rate of age-0 largemouth (79.5 fish/hr) was bolstered by larger age-0 fish from the upper sites of the lake, giving better odds for the 2020 year-class to be stronger than average. Largemouth and spotted bass relative weight metrics (Table 11) were good, with larger fish showing better condition, similar to previous years.

## Crappie

Trap netting for crappie was conducted during mid-November (Table 12). The white crappie population remains strongly dominated by 6.0 - to 7.0 -in fish from multiple persisting year classes (Tables 14 and 15). White crappie size structure index $(\mathrm{PSD}=32$; Table 13) dipped noticeably from prior years $(\mathrm{PSD}=47$ in 2018 and $\mathrm{PSD}=49$ in
2014) due to subpar year classes in 2016 and 2017. The mean age- $2+$ length ( 8.3 in ) of white crappie is reflective of a slower growing, mildly crowded population (Table 16). Age-2+ crappie lengths in years prior to 2006, before moderate crowding began, were typically 9.0 -in plus. The white crappie population assessment remained "Good"; similar to most years (Table 16). The length-weight equation for white crappie in 2020 was similar to previous years:

$$
\log _{10}(\text { weight })=-3.79155+3.44721 \times \log (\text { length })
$$

Black crappie remain low density in trap net samples ( $\mathrm{n}=15$; Table 12), but are now showing up regularly in sampling data across multiple gears (creel, netting and electrofishing).

## Walleye/White bass

Experimental gill net sampling for white bass and walleye was conducted in mid-November (Table 1). White bass CPUE ( $5.4 \mathrm{fish} / \mathrm{nn}$; Table 17) continues to slide from a high in 2015, with diminished contribution from the good 2014 and 2015 year classes (ages $5+$ and $6+$; Table 18). The moderate 2017 year class currently props up this fishery $(27 \%$ of catch; Table 18). Condition indices for all length groups ( $\mathrm{Wr}=94-96$; Table 19) and growth rates (mean length age- $2+=14.2 \mathrm{in}$; Table 20) of white bass remains excellent. The white bass population assessment slipped to "Fair" due to lower fish numbers across all length groups. The length-weight equation for white bass ( $\mathrm{n}=81$ ) was similar to previous years:

$$
\log _{10}(\text { weight })=-3.42911+3.09391 * \log _{10}(\text { Length })
$$

Walleye CPUE ( 0.8 fish/nn) slid further down from prior years' samples and only the 3 most recent year classes were represented (Table 17). Condition indices for all length groups ( $\mathrm{Wr}=91-102$; Table 21) and growth rate (20.2 inches by age- $2+$; Table 22) remain excellent. The walleye population assessment fell to "Poor" due to low CPUE of larger fish. The high water years of 2018, 2019 and 2020 afforded greater opportunities for walleye emigration via lake discharges and perhaps explains some of the decrease in walleye numbers. The length-weight equation for walleye ( $\mathrm{n}=23$ ) was similar to previous years:

$$
\log _{10}(\text { weight })=-3.65988+3.18484 * \log _{10}(\text { Length })
$$

## Metcalfe County Lake (22 acres)

## Black Bass

Largemouth bass were sampled by diurnal electrofishing on May 20 (Table 1); two- to four-weeks later than the normal sampling window due to persisting muddy water from above average spring rainfall. Bass CPUE (220.0 fish/hr; Table 23) was similar to most of the prior 10 years (Table 24). The size structure remains diverse (PSD = $35, \operatorname{RSD}=21$; Table 25) and similar to previous years. CPUE of 20.0-in plus fish dipped dramatically to an all-time low ( $2.0 \mathrm{fish} / \mathrm{hr}$ ), likely due to the later sample date and larger bass having spawned and moved out/off shore. The lake consistently averages 6.0-8.0 fish/hr for this length group, which is well above any waterbody in the Southwest District.

## Channel Catfish

Channel catfish were sampled with tandem set hoop nets in mid-September of 2020, which was an off-year for catfish stocking (Table 1). The sample was dominated by 2019 stocked fish (9.0-11.0 in; $85 \%$ of sample; Table 26). In 2014, catfish were stocked the same year as the sample (couple of months prior to sampling), which resulted in double the catch rate ( $12.5 \mathrm{fish} / \mathrm{nn}$ ). Condition $(\mathrm{Wr}=88$; Table 27) was fair for intermediate sizes (11.0-15.9 in).

## Mill Creek Lake (109 acres)

## Black Bass

Bass were sampled by nocturnal electrofishing on May 1 (Table 1). Catch rates of larger fish remained similar to previous years, while catch rates for smaller largemouth bass length groups were well below average (Tables 28 and 29). This necessitated the stocking of 589 largemouth bass ( 5.4 fish/acre; 6.0-11.0 in) in mid-May to bolster the poorer year classes of 2018 and 2019 and increase predation pressure on overly abundant forage. Size structure indices ( $\mathrm{PSD}=79 ; \mathrm{RSD}=46$; Table 30) remain excellent. Age data has not been collected from this population.

Table 1. Lake sampling conditions in the Southwestern Fisheries District in 2020.

# CENTRAL FISHERIES DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Lake sampling conditions for 2020 are summarized in Table 1.

## Taylorsville Lake (3,050 acres)

** Due to COVID-19 restrictions no spring sampling was completed at Taylorsville Lake in 2020.
Length frequency, relative weights, and index for year class strength at age- 0 and age- 1 for largemouth bass based on September electrofishing are presented in Tables 2-4. Average body condition for largemouth bass in $2020\left(\mathrm{~W}_{\mathrm{r}}=90\right.$; Table 3) was acceptable, but lower than the lake's historic average $\left(\mathrm{W}_{\mathrm{r}}=96\right)$. Catch rate of age-0 largemouth bass in the fall of 2020 ( 9.8 fish $/ \mathrm{hr}$ ) was lower than the lake's historic average of $38.4 \mathrm{fish} / \mathrm{hr}$ (Table 4). The year class strength model indicated below-average recruitment for young-of-the-year largemouth bass in 2020. This was the third straight year of below average recruitment.

Trap netting effort for crappie (Table 5) resulted in the collection of 570 white crappie and 34 black crappie. Crappie were sampled with trap nets during 48 net-nights. PSD and $\operatorname{RSD}_{10}$ values are shown in Table 6. Age and growth determinations and age frequency for black and white crappie were completed using otoliths (Tables 7-10). Age studies indicated both white and black crappie reach the 10.0 -in size limit between age- 3 and age-4. The crappie population assessment scores (Tables 11 and 12) rated white crappie as "Excellent" and black crappie as "Poor". Historically, the crappie population at Taylorsville Lake has been very cyclic with peaks occurring every 7 to 9 years. Significant spawns have occurred in 2013, 2015 and 2019 based off trap net data. Body condition of white and black crappie in the fall of 2020 was very good (Table 13).

Fall gill netting for hybrid striped bass, white bass, and saugeye was conducted in October 2020 (Tables 14-25). Hybrid striped bass were captured in 8 net-nights (nn) for a CPUE of 7.9 fish/nn. Age and growth studies were completed for hybrid striped bass using otoliths (Tables 15 and 16). Data indicate hybrid striped bass have good growth, reaching 15.0 in between age-1 and age-2. The relative weight $\left(\mathrm{W}_{\mathrm{r}}\right)$ index for hybrid striped bass was 92 in 2020 which is an above-average body condition $\left(\mathrm{W}_{\mathrm{r}}=86\right)$ at Taylorsville Lake (Table 17). The population assessment for hybrid striped bass was rated at "Good" (Table 18). Taylorsville Lake was stocked with 54,904 (18.0 fish/acre; 1.3 in ) reciprocal-cross hybrid striped bass in June 2020. No original-cross hybrid striped bass were stocked in 2020. Data for white bass collected during fall 2020 gill netting studies are presented in Tables 14 and 19-22. Age and growth studies indicate white bass reach 11.7 in by age 2 and good year classes were produced in 2018, 2019, and 2020 (Tables 19 and 20). Relative weight values ( $\mathrm{W}_{\mathrm{r}}=96$ ) revealed acceptable body conditions for all sizes of white bass (Table 21). The white bass population assessment was rated "Good"; an above average rating for white bass at Taylorsville Lake (Table 22). Saugeye were collected during fall gill netting conducted in October 2020. A total of 120 saugeye were collected ranging from the 10.0 - to 24.0 -in size class (Table 14). Age and growth studies were completed using otoliths. Calculations indicated, on average, saugeye reach the 14.0 -in size limit between age-1 and age-2, and 20.0 in between age- 3 and age- 4 (Table 23). Five year classes were represented during the sample (Table 24). The relative weight $\left(\mathrm{W}_{\mathrm{r}}\right)$ index for saugeye (95) showed good body condition (Table 25). Taylorsville Lake was stocked with 8,840 saugeye ( 2.9 fish/acre; 1.25 in) in May 2020.

Summer diurnal low-pulse electrofishing was completed in July 2020 to assess the blue catfish population. Two sections (Lower Lake: Big Beech Creek and Ashes/Jacks Creek, and Upper Lake: Chowning Lane area) of Taylorsville Lake were sampled for 3.0 hours (12-15-minute runs). Two hundred and eighteen blue catfish were collected in the lower section compared to 156 blue catfish collected in the upper section of the lake (Table 26). The number of blue catfish collected in 2020 ( $124.7 \mathrm{fish} / \mathrm{hr}$ ) was slightly lower than the lake's historic average of $126.1 \mathrm{fish} / \mathrm{hr}$ (Table 27). Relative weight values revealed good body condition for all sizes of blue catfish (Table 28). A subsample of blue catfish were collected for age determination during the July sample. Additionally, the creel clerk collected fish greater than 30.0 in from anglers throughout the year. Blue catfish, on average, reached
25.0 in between age- 8 and age- 9 , and 30.0 in by age-11 (Table 29). Blue catfish were represented in the sample up to age-18+, which represent the second year class (2003 stocking) stocked at Taylorsville Lake. The majority of the sample ( $78.0 \%$ ) was comprised of age- 3 to age- 5 fish (Table 30). No blue catfish were stocked in 2020 in an effort to evaluate natural reproduction.

A roving daytime angler creel survey was conducted at Taylorsville Lake from mid-March through October. The last creel survey conducted at Taylorsville Lake was in 2016. Table 31 provides descriptive statistical parameters of the lake fishery over the past 5 creel surveys. The number of fishing trips in 2020 ( 51,147 trips) significantly increased, almost doubling, from 2016 ( 26,303 trips), but was fairly similar to the 2003 survey. Overall, the number of fishing trips in 2020 was slightly lower than the lake's historical average of 53,019 trips. The increase from recent years was probably due the Covid19 pandemic. Many people were off due to work closures and people had the time to go fishing. Many people utilized public lakes as an outlet for something to do during this shutdown. Likewise, total fishing pressure (man-hours), number of fish caught, number of fish harvested, and pounds of fish harvested all significantly increased from the 2016 and recent past creel surveys. Other parameters such as gender, residency and mode have remained about the same as past surveys. However, there was a notable increase in trolling on the lake in 2020.

Numbers of largemouth bass caught in 2020 ( 61,052 fish) increased by 8,875 fish from numbers seen in 2016 (Tables 32 and 33), while numbers of largemouth bass harvested in 2020 ( 1,112 fish) was the lowest observed during any of the 14 creel surveys completed at Taylorsville Lake since 1986. Mean length of largemouth bass harvested was 15.6 in which was the smallest average size recorded in the history of the 14 creel surveys completed at Taylorsville Lake (Table 32). The number of fishing trips for black bass in 2020 was 12,253 ; less than the historic average of 21,788 trips annually recorded during past creel surveys. In 2020, black bass continue to be the second most sought-after group fished for in Taylorsville Lake. The catch rate of bass by bass anglers in $2020(1.01 \mathrm{fish} / \mathrm{hr})$ was lower than the catch rates in $2009(1.19 \mathrm{fish} / \mathrm{hr})$ and $2016(1.49 \mathrm{fish} / \mathrm{hr})$. Bass angler success rate for harvesting a bass declined to $5.1 \%$ from $9.7 \%$ in 2016. Largemouth bass continue to dominate the black bass population with only incidental catches of smallmouth bass, which are mainly caught in the upper reaches of the lake. Black bass catch, harvest and monthly angling success are shown in Tables 34 and 35.

Numbers of crappie caught $(350,573)$ in 2020 was significantly higher than any crappie numbers caught in recent years (Tables 32 and 33). However, it is lower than the highest catch of crappie in a year at Taylorsville Lake which was 387,495 crappie back in 1989. Additionally, the number of crappie harvested $(225,604)$ was significantly higher than recent years; however, lower than the highest number of crappie in a year at Taylorsville Lake (299,715 fish in 1989). Mean length of white and black crappie harvested were both 10.6 in (Tables 32 and 36). Like 2016, crappie were the most sought-after group fished for at Taylorsville Lake in 2020. The number of fishing trips for crappie was 21,982 trips in 2020, which is significantly higher than average number of trips ( 11,360 trips) for crappie during creel surveys at Taylorsville Lake. Harvest rates by crappie anglers improved to 1.80 fish/hr, which almost doubled rates from 2016 ( 0.94 fish $/ \mathrm{hr}$ ). Percent success of crappie anglers increased from $58.2 \%$ in 2016 to $81.1 \%$ in 2020 . White crappie represented $94.9 \%$ of the crappie caught $(80.2 \%$ in 2016 ) and $92.0 \%$ of the crappie harvested ( $69.8 \%$ in 2016). Crappie catch, harvest and monthly angling success are shown in Tables 36 and 37.

The third most sought-after group was catfish with 5,455 trips by catfish anglers compared to the historical average of 2,900 trips. Overall, 23,398 catfish were caught in 2020, an increase from 15,040 catfish in 2016, but slightly lower than the historical average of 25,655 (Table 32). Blue catfish contributed $44.7 \%$ of the catfish caught, compared to $52.6 \%$ in 2016 and $47.0 \%$ in 2009. Pounds of channel catfish harvested was $7,604 \mathrm{lbs}$ which was lower than the lake average of $11,355 \mathrm{lbs}$. In $2020,12,246 \mathrm{lbs}$ of blue catfish were harvested which was less than the amount harvested in the $2016(25,970 \mathrm{lbs})$ and $2009(19,182 \mathrm{lbs})$ creel surveys. Mean length of channel catfish harvested by catfish anglers was 14.4 in (14.9 in 2016); blue catfish was 16.6 in (20.9 inches in 2016) and flathead catfish was 16.2 in ( 25.5 inches in 2016). Harvest rate by catfish anglers in $2020(0.63 \mathrm{fish} / \mathrm{hr})$ was nearly identical to the harvest rate in 2016 ( 0.64 fish $/ \mathrm{hr}$ ). Success rate for catfish anglers has decreased from $80.0 \%$ in 2009, to $66.1 \%$ in 2016 and $61.0 \%$ in 2020. Catfish catch, harvest and monthly angling success are shown in Tables 38 and 39.

The Morone group (hybrid striped bass and white bass) accounted for $3.4 \%$ of all trips at Taylorsville Lake in 2020 (Table 32). The number of hybrid striped bass (HSB) caught increased from 1,461 fish (357 harvested) in 2016 to 2,030 fish (265 harvested) in 2020. White bass (WB) caught increased to 5,721 fish in $2020(4,209$
harvested) from 904 caught in 2016 ( 737 harvested). Pounds of HSB harvested in 2020 totaled 816 lbs ( $0.3 \mathrm{lbs} / \mathrm{a}$ ), whereas in 2016 it was $286 \mathrm{lbs}(0.09 \mathrm{lbs} / \mathrm{a})$. WB harvest in 2020 totaled $2,360 \mathrm{lbs}(0.8 \mathrm{lbs} / \mathrm{a})$ while in 2016 it was $327 \mathrm{lbs}(0.11 \mathrm{lbs} / \mathrm{a})$. Mean length of HSB harvested in 2020 was 18.3 in while in 2016 it was 12.2 in . Mean length of WB harvested in 2020 was 11.7 in, with 8.5 in being the average in 2016. The number of trips for Morones increased from 476 trips in 2016 to 1,723 trips in 2020. Hours spent fishing for these fish also increased from 2,144 hrs ( $0.7 \mathrm{hrs} / \mathrm{a}$ ) in 2016 to $7,780 \mathrm{hrs}$ ( $2.6 \mathrm{hrs} / \mathrm{a}$ ) during 2020. Harvest rate for Morone anglers decreased from 2016 ( $0.63 \mathrm{fish} / \mathrm{hr}$ ) to $2020(0.44 \mathrm{fish} / \mathrm{hr})$. Success rate for these anglers increased from $31 \%$ in 2016 to $38 \%$ in 2020. Morone catch, harvest and monthly angling success are shown in Tables 40 and 41.

Panfish, primarily bluegill, accounted for $3.4 \%$ of all trips with a total of 124,468 fish caught during the 2020 season. Pounds harvested in 2020 was higher than that seen in 2016 -going from $2,415 \mathrm{lbs}(0.79 \mathrm{lbs} / \mathrm{a})$ in 2016 to $13,063 \mathrm{lbs}(4.3 \mathrm{lbs} / \mathrm{a})$ in 2020. The average length of bluegill harvested in $2020(5.8 \mathrm{in})$ was exactly the same as in 2016. Trips for panfish increased from 1,106 trips in 2016 to 1,723 trips in 2020. The harvest rate for panfish in $2020(5.5 \mathrm{fish} / \mathrm{hr})$ increased from that recorded in 2016 ( $2.4 \mathrm{fish} / \mathrm{hr}$ ). The percentage of successful panfish anglers was $89 \%$ while in 2016 it was $88 \%$. Length distribution and numbers of species caught and harvested are shown in Table 33.

An angler attitude survey was conducted at Taylorsville Lake during the creel survey. Surveys were completed in the field by the creel clerk. A total of 469 surveys were completed in 2020 ( 212 surveys in 2016 and 278 surveys in 2009). The attitude survey reflected that $28.8 \%$ of all anglers fished for bass, compared to $34.4 \%$ in 2016 and $26.3 \%$ in 2009. Crappie continues to be most sought-after species at Taylorsville Lake. In 2020, 44.3\% of all anglers fished for crappie, compared to $84.0 \%$ in 2016 and $57.6 \%$ in 2009. Channel catfish and blue catfish are targeted by $17.7 \%$ and $17.3 \%$ of all anglers, respectively. Saugeye, hybrid striped bass, bluegill and white bass were each targeted by less than $10 \%$ of all anglers at Taylorsville in 2020. Bass anglers ( $97.0 \%$ ) and crappie anglers ( $99.5 \%$ ) in 2020, expressed high levels of satisfaction, which increased from the 2009 and 2016 surveys. Eighty percent of crappie anglers were satisfied with the current 10.0-in size limit. Black bass, white bass, hybrid striped bass, and catfish anglers were all satisfied with the current size and creel limits for those species.

## Herrington Lake (2,410 acres)

** Due to Covid19 restrictions no spring sampling was completed at Herrington Lake in 2020.
Length frequency, age and growth, relative weights and index of year class strength at age- 0 for largemouth bass based on September electrofishing at Herrington Lake are presented in Tables 42-46. The growth rates of largemouth bass at Herrington Lake are very good. Largemouth bass growth rates indicated bass are reaching harvestable size ( 12.0 in ) during their third growing season and 15.0 inches in four growing seasons (Table 43). Largemouth bass condition ( $\mathrm{W}_{\mathrm{r}}=93$ ) was higher than the lake's historic average ( $\mathrm{W}_{\mathrm{r}}=92$; Table 44) and spotted bass condition was very good ( $\mathrm{W}_{\mathrm{r}}=96$; Table 45 ). Age-0 CPUE for largemouth bass ( $16.4 \mathrm{fish} / \mathrm{hr}$ ) was less than the lake average ( $35.0 \mathrm{fish} / \mathrm{hr}$; Table 46). No largemouth bass were stocked in 2020.

Gill netting for hybrid striped bass and white bass was completed in October 2020. During the 14 net-night sampling period, 158 hybrid striped bass and 170 white bass were collected (Table 47). Otoliths were taken from both species for age and growth determinations. Results of these studies indicated excellent growth rates for both hybrids (Tables 48 and 49) and white bass (Tables 52 and 53). Hybrid striped bass reached 15.0 in between age-1 and age-2 (Table 48), as they have historically. Of the hybrid striped bass sampled, $89 \%$ were age- $1+$ or older (Table 49). Condition of hybrid striped bass in $2020\left(\mathrm{~W}_{\mathrm{r}}=95\right)$ was higher than the lake's historic average $\left(\mathrm{W}_{\mathrm{r}}=93\right.$; Table 50). The population assessment for hybrid striped bass indicated a "Good" population (Table 51). White bass age and growth determinations showed that white bass reached 12.0 in between age- 1 and age- 2 (Table 52). Of the white bass sampled, $98 \%$ were age- $1+$ and older (Table 53). The white bass population assessment indicated an "Excellent" population (Table 54). Body condition of white bass ( $\mathrm{W}_{\mathrm{r}}=97$ ) was higher than the lake's historic average ( $\mathrm{W}_{\mathrm{r}}=96$; Table 55). Herrington Lake was stocked with 44,098 (18.3 fish/acre; 1.4 in ) reciprocal-cross hybrid striped bass in June 2020. No original-cross hybrid striped bass were stocked in 2020.

## Guist Creek Lake (317 acres)

** Due to COVID-19 restrictions no spring sampling was completed at Guist Creek Lake in 2020.
Fall largemouth bass sampling was conducted for length frequency, relative weights and index of year class strength at age-0 (Tables 56-58). Relative weights indicated good body condition for bass, especially for bass over 15.0 in (Table 57). The catch rate of age-0 largemouth bass ( $32.0 \mathrm{fish} / \mathrm{hr}$ ) was lower than the average recruitment (avg. $=47.3 \mathrm{fish} / \mathrm{hr}$; Table 58). No largemouth bass were stocked into Guist Creek Lake in 2020.

An attempt was also made to survey saugeye during the fall bass sample, but no saugeye were collected (Table 56). Due to the limited number of saugeye available from the hatchery, no saugeye were stocked in Guist Creek Lake in 2020. Prior to 2020, saugeye have been stocked annually since 2013.

Guist Creek Lake was stocked with 9,502 (30.0 fish/acre; 1.6 in) reciprocal-cross hybrid striped bass in June 2020.

## Beaver Lake (158 acres)

A spring diurnal electrofishing sample was completed in May 2020 to assess the black bass population (Table 59). The CPUE for all sizes was 354.5 fish $/ \mathrm{hr}$, greater than the lake average of $255.0 \mathrm{fish} / \mathrm{hr}$ (Table 60). The PSD and $\operatorname{RSD}_{15}$ for largemouth bass were 17 and 4, respectively, compared to the current lake average of 27 and 4 (Table 61). The population assessment score indicated a "Good" bass population (Table 62), which is the average assessment rating for Beaver Lake. Fall diurnal electrofishing was conducted for relative weights and index of age0 year class strength of largemouth bass (Tables 63-65). The overall relative weight indicates acceptable condition $\left(\mathrm{W}_{\mathrm{r}}=87\right)$; the lake average is 85 (Table 64). Fall sampling indicated above-average numbers of age-0 bass, (232.0 fish $/ \mathrm{hr}$; average $=137.8 \mathrm{fish} / \mathrm{hr}$ ) and the average size of largemouth bass ( 3.7 in ) was lower than the lake's average of 4.3 in (Table 65).

During September and October an effort was made to reduce the crowded largemouth bass population at Beaver Lake. One thousand eight hundred and five (11.4 fish/acre) largemouth bass were removed from Beaver Lake during three separate events. Largemouth bass removed ranged in size from 4.0 to 11.0 in ( $<8.0$ in $=673$ $(37.2 \%) ; 8.0-10.9 \mathrm{in}=902(50.1 \%) ; 11.0$ in $=230(12.7 \%)$ ).

Relative weights for bluegill and redear sunfish were collected during the fall diurnal electrofishing sample. Overall, relative weight data for bluegill was "fair" while the body condition of redear sunfish was "excellent" (Table 66). Redear sunfish (31,600 fish; 200.0 fish/acre) were stocked in September 2020 at an average size of 1.2 in.

Channel catfish (3,700 fish; 23.4 fish/acre) averaging 9.5 in were stocked into Beaver Lake in September 2020.

In May, 675 lbs of granular 10-52-4 fertilizer was applied in Beaver Lake. One application of aquatic herbicide was applied in June 2020 to maintain bank fishing areas, the boat ramp and fishing pier at Beaver Lake.

A time-lapse camera was installed at Beaver Lake at the boat ramp access from March 2020-February 2021 to estimate total usage (trips) and pressure (hours) at this public access area. This approach differs from previous daytime roving creel surveys in that these counts capture all usage types (boat anglers, bank anglers and recreational boaters). However, the primary usage of this site was by anglers. The time-lapse camera recorded a picture of the entire fishing area (parking lot, boat ramp and fishing pier) every 10 minutes during daylight hours throughout the study period. Images were analyzed by randomly selecting 16 days each month, which included an a.m. or p.m. period. During those selected dates and times, individual vehicles were selected for each fishing type (trailered boat, carry-down boat, bank), party size per vehicle and total trip lengths were recorded. A total individual vehicle count was also collected for the entire day. From these counts, monthly averages were calculated.

Overall, it was estimated that 11,229 trips (71.1 trips/acre) were taken to Beaver Lake from March 2020February 2021 (Table 67). Monthly trip totals ranged from 21 trips in February 2021 to 2,516 trips in May 2020 (Figure 1). Eighty-four percent of the trips to Beaver Lake occurred from April-September 2020. The average trip length for the year was 3.3 hours. Average trip lengths ranged from 2.2 hours in February 2021 to 3.9 hours in September 2020. May ( 9,512 hours), June ( 5,408 hours) and July ( 5,007 hours) recorded the highest usage rates (Figure 2). It was estimated that Beaver Lake received 39,049 hours ( 247.1 hours/acre) of recreational pressure during this 12-month study period (Table 67).

An angler attitude survey was conducted at Beaver Lake from March-October 2020. The district's seasonal creel clerk and district staff conducted these surveys. A total of 222 surveys were completed by individual anglers. The attitude survey reflected the largest majority of anglers fished for bluegill ( $41.4 \%$ ) and largemouth bass (27.9\%). The majority of anglers expressed satisfaction for their species of preference in 2020. Overall, anglers were $98.1 \%$ satisfied with the current regulations at Beaver Lake. However, anglers were also asked if they would support regulation changes that would allow for the harvest of largemouth bass less than 12.0 in. Eighty-two percent of all anglers stated they would support this regulation. Of those anglers, $72.7 \%$ stated they would also harvest these fish. Overall, anglers ( $77.4 \%$ ) were satisfied with the facilities (parking lot, boat ramp, fishing pier, courtesy dock and restroom) at Beaver Lake. Of those anglers that were not satisfied with the facilities, $85.7 \%$ stated it was due to the condition and grade of the boat ramp.

## Benjy Kinman Lake (88 acres)

A spring nocturnal electrofishing sample was completed in May 2020 at Benjy Kinman Lake to assess the black bass population (Table 68). The CPUE for all sizes was $151.0 \mathrm{fish} / \mathrm{hr}$, compared to the lake average of 145.3 fish/hr (Table 69). The PSD and $\mathrm{RSD}_{15}$ for largemouth bass were 21 and 11, respectively (Table 70). The population assessment score indicated a "Fair" bass population (Table 71). Fall largemouth bass sampling was conducted for relative weights and index of year class strength at age-0 in September 2020 (Tables 72-74). Overall, relative weights indicated below-average body condition for bass ( $\mathrm{W}_{\mathrm{r}}=87$ ) with larger fish exhibiting better condition compared to smaller length groups (Table 73). The better condition of larger fish is due to the gizzard shad forage base. Fall sampling indicated above-average numbers of age-0 bass, ( 104.0 fish $/ \mathrm{hr}$; average $=76.0$ fish $/ \mathrm{hr}$ ) and the average size of largemouth bass ( 4.8 in ) was higher than the lake's average of 4.6 in (Table 74).

A spring diurnal electrofishing sample was completed at Benjy Kinman Lake in May 2020 to assess the panfish populations (Tables 75-78). Length frequency results showed a good distribution of bluegill through the 7.0 -in size range (Tables 75 and 77). The PSD and $\operatorname{RSD}_{8}$ for bluegill was 57 and 0 , respectively (Table 76). Length frequency results showed the majority of the redear sunfish were in the 6.0 - to 7.0 -in size range (Tables 75 and 78). Redear sunfish PSD and $\mathrm{RSD}_{9}$ was 49 and 2, respectively (Table 76). Relative weights for bluegill and redear sunfish were collected during the fall bass sample at Benjy Kinman Lake (Table 79). Overall, relative weights were "fair" for bluegill and "good" for redear sunfish.

Channel catfish were sampled in October and December 2020 using tandem hoop nets. Length frequency results for channel catfish showed a size distribution between the 10.0 -in and 28.0-in size class (Table 80). PSD and $\mathrm{RSD}_{24}$ were 26 and 3, respectively (Table 81). Size distribution has improved since the initial sample in 2015 (Table 82). Relative weights indicated a good body condition for channel catfish ( $\mathrm{W}_{\mathrm{r}}=92$; Table 83). Additionally, an age and growth sample was collected during the December sample of channel catfish less than 15.0 in. Twentyone fish were aged and all were age-1+, representing the 2019 year class. The significance of this finding was documenting channel catfish recruitment. No channel catfish stockings have occurred at Benjy Kinman Lake since February 2017, which represent 2016-year class fish. Additionally, 15 wooden catfish spawning boxes were installed during May 2020 in an effort to promote channel catfish spawning. All boxes were evaluated for usage weekly beginning on June $9^{\text {th }}$ through July $14^{\text {th }}$. Of the 15 boxes, fish were observed using two of these boxes. One box was observed with a spawning pair and one with adult catfish and fry.

Six rough fish removal events took place from March 2020- March 2021 resulting in a total of 94 bigmouth buffalo, smallmouth buffalo, common carp, freshwater drum and longnose gar being removed from Benjy Kinman Lake. The average weight of rough fish removed in 2020-21 was 10.0 lbs . Therefore, it was estimated that 940 lbs of rough fish were removed. The seven-year total for rough fish removed from Benjy Kinman Lake is 4,239 fish
( 48.2 fish/acre) at an estimated weight of $32,561 \mathrm{lbs}$ ( $370.0 \mathrm{lbs} /$ acre). In March 2021, the Kentucky River overtopped the dam on Benjy Kinman Lake and additional sampling will be conducted to evaluate the effects on this fishery.

Three hundred and fifty pounds of granular fertilizer (10-52-4) was applied in April 2020 at Benjy Kinman Lake. A second treatment of 350 pounds was applied in May 2020. One application of aquatic herbicides in May 2020 was applied to maintain areas around the parking lot, boat ramp and courtesy dock.

A few habitat projects were completed at Benjy Kinman Lake in 2020-2021. Water willow collected from the spillway at Elmer Davis and Boltz lakes were transplanted into Benjy Kinman Lake to create 7 new water willow beds during the summer 2020. Eight rock piles were constructed using 85 tons of shot rock.

## Boltz Lake (92 acres)

** Due to Covid19 restrictions no spring sampling was completed at Boltz Lake in 2020.
Fall diurnal electrofishing was conducted for relative weights, index of age-0 year class strength and age and growth in September 2020 (Tables 84-87). Age and growth studies indicate that largemouth bass reach 12.0 in by age 3 and 15.0 in at age $5+$ (Table 85). Relative weights indicated acceptable body condition $\left(\mathrm{W}_{\mathrm{r}}=93\right)$, higher than the lake's average relative weight of 90 (Table 86). Fall sampling indicated above average numbers of age-0 bass, ( $239.3 \mathrm{fish} / \mathrm{hr}$; average $=51.9 \mathrm{fish} / \mathrm{hr}$ ) but the average size (3.6 in) was smaller than the lake's average size of 4.2 in (Table 87). No bass were stocked into Boltz Lake in 2020.

Saugeye were collected during fall largemouth bass sampling at a rate of 4.7 fish/hr with fish ranging from the 19.0 - to 21 -in size class (Table 84). Saugeye ( 9,200 fish; 100 fish/acre) averaging 1.3 in were stocked into Boltz Lake in May 2020.

Spring diurnal electrofishing for bluegill and redear sunfish was conducted in June 2020 (Table 88). The overall catch rate for bluegill ( 532.0 fish/hr) continues to be higher than the lake average ( $498.6 \mathrm{fish} / \mathrm{hr}$; Table 89). The PSD for bluegill was 51 compared to the lake average of 24 (Table 90 ). The $\mathrm{RSD}_{8}$ was 3 compared to the lake average of 1. The population assessment for bluegill indicated an "Excellent" population, which has been the rating since 2018 (Table 91). The relative weight index reflected acceptable body condition for bluegill $\left(\mathrm{W}_{\mathrm{r}}=94\right)$ at Boltz Lake in 2020 (average $\mathrm{W}_{\mathrm{r}}=90$; Table 92).

Three treatments of aquatic herbicides were applied to the spillway area at Boltz Lake in May, June and July 2020.

## Bullock Pen Lake (134 acres)

** Due to Covid19 restrictions no spring sampling was completed at Bullock Pen Lake in 2020.
Fall diurnal electrofishing was conducted in September 2020 to determine length frequency, relative weights and index of age-0 year class strength for largemouth bass (Tables 93-95). Relative weights indicated fair body condition for bass ( $\mathrm{W}_{\mathrm{r}}=88$ ), lower than the lake's average ( $\mathrm{W}_{\mathrm{r}}=94$; Table 94). Larger fish exhibited better condition compared to smaller length groups, which is a function of the shad forage base. Age-0 CPUE (30.0 fish/hr) was higher than the lake average ( $21.7 \mathrm{fish} / \mathrm{hr}$ ); therefore, no largemouth bass were stocked in 2020 (Table 95).

Saugeye were collected during the fall largemouth bass sample. Only three saugeye ( $2.0 \mathrm{fish} / \mathrm{hr}$ ) were collected ranging from the 12.0 - to 22.0 -in size class (Table 93).

Channel catfish were sampled in October 2020 using tandem hoop nets. Length frequency results for channel catfish showed a range from the 8.0 - to 24.0 -in size class (Table 96). The PSD and $\mathrm{RSD}_{24}$ for channel catfish were 29 and 2, respectively (Table 97). Relative weights of channel catfish were acceptable ( $\mathrm{W}_{\mathrm{r}}=92$; Table
98). Overall, catch rates at Bullock Pen Lake (36.3 fish/set) remained lower than the lake average of 71.4 fish/set (Table 99).

A time-lapse camera was installed at Bullock Pen Lake, at the boat ramp access, from March 2020February 2021 to estimate total usage (trips) and pressure (hours) at this public access area. However, due to a camera malfunction no data was collected during March and November 2020. Therefore, those two months are not included in the trip and pressure estimates. This approach differs from previous daytime roving creel surveys in that these counts capture all usage types (boat anglers, bank anglers and recreational boaters). However, the primary usage of this site was by anglers. The time-lapse camera recorded a picture of the entire fishing area (parking lot and boat ramp) every 10 -minutes during daylight hours throughout the study period. Images were analyzed by randomly selecting 16 days each month, which included an a.m. or p.m. period. During those selected dates and times, individual vehicles were selected for each fishing type (trailered boat, carry-down boat, bank), party size per vehicle and total trip lengths were recorded. A total individual vehicle count was also collected for the entire day. From these counts, monthly averages were calculated.

Overall, it was estimated that 6,840 trips ( 51.0 trips/acre) were taken to Bullock Pen Lake from March 2020-February 2021, which does not include March and November 2020 due to camera malfunction (Table 100). Monthly trip totals ranged from 4 trips in February 2021 to 1,329 trips in July 2020 (Figure 3). Eighty-three percent of the trips to Bullock Pen Lake occurred from April-August 2020. The average trip length for the year was 3.5 hours. Average trip lengths ranged from 2.3 hours in February 2021 to 4.6 hours in May 2020. May ( 5,545 hours), June ( 4,332 hours) and July ( 4,227 hours) recorded the highest usage rates (Figure 4). It was estimated that Bullock Pen Lake received 25,467 hours ( 190.1 hours/acre) of recreational pressure during this 12 -month study period (Table 100). This total does not include data for March and November 2020 due to camera malfunction.

## Corinth Lake (96 acres)

Fall diurnal electrofishing for largemouth bass was conducted to determine length frequency, relative weight and year class strength (Tables 101-103). Relative weights of largemouth bass continue to be below average across the 8.0 - to 11.9 -in and 12.0 - to 14.9 -in length groups. The overall relative weight in $2020\left(\mathrm{~W}_{\mathrm{r}}=85\right)$ was higher than the historic average relative weight at Corinth Lake ( $\mathrm{W}_{\mathrm{r}}=84$; Table 102). Age-0 CPUE ( $82.7 \mathrm{fish} / \mathrm{hr}$ ) was similar to the lake average ( $87.7 \mathrm{fish} / \mathrm{hr}$ ); therefore, no largemouth bass were stocked in 2020 (Table 103).

Spring diurnal electrofishing for bluegill and redear sunfish was completed in June 2020 to obtain length frequency, CPUE and population assessment data (Table 104). Bluegill PSD (39) was higher than the lake average of 33 (Table 105). The bluegill catch rate ( 300.8 fish $/ \mathrm{hr}$ ) continued to increase and was higher than the lake average (243.0 fish/hr; Table 106). The population assessment indicated a "Good" population, which is the average rating (Table 107). The redear sunfish catch rate ( 156.8 fish $/ \mathrm{hr}$ ) continues to be higher than the lake's average ( 80.8 fish/hr; Table 108). Redear sunfish PSD was 80, higher than the lake average of 56 (Table 105). Catch rate for redear sunfish $\geq 8.0$ in was 43.2 fish $/ \mathrm{hr}$; remaining higher than the lake average of 28.7 fish $/ \mathrm{hr}$ (Table 108). The population assessment for redear sunfish was rated as "Fair" (Table 109). Fall diurnal electofishing for bluegill and redear sunfish was conducted for age and growth and relative weights. Age and growth studies show that bluegill reach 6.0 in between age- 3 and age- 4 and redear sunfish reach 8.0 in between age- 5 and age- 6 (Tables 110 and 111) Relative weights indicated fair condition for bluegill (87) and good condition for redear sunfish (93; Table 112).

Channel catfish were sampled in October at Corinth Lake using tandem hoop nets. Length frequency results for channel catfish showed a size distribution between the 17.0 and 25.0 -in size classes (Table 113). The PSD and $\operatorname{RSD}_{24}$ for channel catfish was 100 and 20, respectively (Table 114). Relative weights indicated "Excellent" body condition for channel catfish ( $\mathrm{W}_{\mathrm{r}}=104$; Table 115). Overall, catch rates at Corinth Lake remain lower than the lake average of 53.4 fish/set (Table 116).

No fertilizer was applied at Corinth Lake due to adequate water clarities throughout the spring 2020.

## Elmer Davis Lake (149 acres)

Fall electrofishing evaluated largemouth bass age and growth, relative weight and index of year class strength at age-0 (Tables 117-120). Age and growth data indicate that largemouth bass reach 12.0 in between age- 3 and age-4 and 15.0 in between age- 7 and age-8 (Table 118). Largemouth bass relative weight $\left(\mathrm{W}_{\mathrm{r}}=82\right)$ was less than the historical lake average ( $\mathrm{W}_{\mathrm{r}}=87$; Table 119). The year class strength model indicated that 2020 was an above-average year for young-of-year largemouth bass. Age-0 CPUE ( 176.0 fish $/ \mathrm{hr}$ ) was higher than the lake average (140.9 fish/hr; Table 120). Therefore, no largemouth bass were stocked during 2020.

Relative weight index reflects good condition for bluegill $\left(\mathrm{W}_{\mathrm{r}}=93\right)$ and redear sunfish $\left(\mathrm{W}_{\mathrm{r}}=101\right.$; Table 121). Elmer Davis Lake was stocked with 26,200 (175.8 fish/acre) redear sunfish in September 2020.

## Kincaid Lake (183 acres)

Diurnal fall electrofishing for largemouth bass was completed in October 2020 to collect length frequency, relative weight values, and to index the year class strength at age-0 (Tables 122-124). Relative weights were acceptable $\left(\mathrm{W}_{\mathrm{r}}=94\right)$ and higher than the lake average $\left(\mathrm{W}_{\mathrm{r}}=89\right.$; Table 123). CPUE for age-0 bass ( $\left.56.7 \mathrm{fish} / \mathrm{hr}\right)$ was higher than the lake average of 37.9 fish/hr (Table 124). Largemouth bass ( 1,161 fish; 6.3 fish/acre) were stocked into Kincaid Lake in October 2020. These fish ranged from 6.0-11.0 in and came from the Beaver Lake bass removal project.

Channel catfish were sampled in October using tandem hoop nets at Kincaid Lake. Channel catfish collected were distributed from the 7.0- to 26.0-in size classes (Table 125). The PSD and RSD 24 for channel catfish were 53 and 10, respectively (Table 126). Relative weights of channel catfish were acceptable ( $\mathrm{W}_{\mathrm{r}}=93$; Table 127). Channel catfish were collected at 14.0 fish/set-night in 2020 , which is lower than the lake average of 62.0 fish/set-night (Table 128).

## McNeely Lake (51 acres)

Diurnal fall electrofishing for largemouth bass was completed in September 2020 to collect length frequency, relative weight values, and to index the year class strength at age-0 (Table 129-131). Relative weights (87) were less than the lake average $\left(\mathrm{W}_{\mathrm{r}}=89\right)$ in fall 2020 (Table 130). CPUE for age- 0 bass ( $73.0 \mathrm{fish} / \mathrm{hr}$ ) was lower than the lake average of $125.9 \mathrm{fish} / \mathrm{hr}$ (Table 131).

Bluegill and redear sunfish were sampled in June 2020 for length frequency, CPUE, and population assessment (Table 132). The bluegill PSD was 46 compared the lake average of 42 (Table 133). $\mathrm{RSD}_{8}$ was 1 , compared to the lake average of 0.4 . Catch rate for bluegill ( $249.3 \mathrm{fish} / \mathrm{hr}$ ) was lower than the lake average catch rate of 336.0 fish/hr (Table 134). The population assessment rating for bluegill was "Good" (Table 135). The total catch rate for redear sunfish ( 45.3 fish $/ \mathrm{hr}$ ) was lower than the lake average ( $56.6 \mathrm{fish} / \mathrm{hr}$; Table 136). The PSD for redear sunfish was 69 compared to the lake average of 48 and the $\mathrm{RSD}_{9}$ was 6 compared to the lake average of 8 (Table 133). The redear sunfish population assessment rated this fishery as "Good" in 2020 (Table 137). Relative weights for bluegill and redear sunfish were collected during the fall diurnal electrofishing sample. Overall, condition for bluegill (87) was fair and good for redear sunfish (92; Table 138).

McNeely Lake was stocked with 1,275 (25.0 fish/acre; 9.2 in) channel catfish in September 2020.

## General Butler State Park Lake

A rough fish removal was completed in November 2020 at General Butler State Park Lake. During this event, 174 bigmouth buffalo, common carp and smallmouth buffalo were removed with an average weight of 9.42 lbs. Therefore, it was estimated that $1,639 \mathrm{lbs}$ of fish were removed in 2020. In total, since 2019, 550 fish (19.4 fish/acre) have been removed for an estimated total weight of 5,937 lbs ( $209.0 \mathrm{lbs} / \mathrm{acre}$ ).

## Kentucky River WMA (Boone Tract: Prather Pond and 6-acre pond)

In December 2019, a low concentration ( 0.2 ppm ) of rotenone was applied to both of these ponds in an effort to eradicate the gizzard shad population. In April 2020, sampling was completed on each pond to evaluate the sport fish populations and the success of the rotenone treatment.

## Prather Pond

Length frequency, relative abundance, and CPUE of fishes collected in April 2020 by electrofishing at Prather Pond are shown in Table 139. Largemouth bass were collected from the 4.0- to 18.0 -in size classes. Bluegill and redear sunfish were collected up to the 7.0 -in and 8.0 -in size classes, respectively. White and black crappie were also collected. A total of 0.5 hours of electrofishing was completed for the presence of gizzard shad. Two gizzard shad were collected and removed. No other gizzard shad were observed.

In May 2020, two weeks after the initial survey, a total of 204 redear sunfish (3.0-7.0 in) were moved from Prather Pond and relocated to the Boone Tract 15 -acre lake. During this event an additional 0.5 hours of electrofishing was completed for gizzard shad and none were collected or observed.

## Boone Tract 6-acre pond

Length frequency, relative abundance, and CPUE of fishes collected in April 2020 by electrofishing at the Boone Tract 6-acre pond are shown in Table 140. Largemouth bass were collected from the 4.0 - to 15.0 -in size classes. Bluegill were collected up to the 8.0 -in size class. Black crappie and redear sunfish were also collected. A total of 0.6 hours of electrofishing was complete for the presence of gizzard shad. No gizzard shad were collected or observed during this survey.

Table 1. Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body | Species | Date | $\begin{aligned} & \text { Time } \\ & \text { (24hr) } \end{aligned}$ | Gear | Weather | Water temp. F | Water level | Secchi (in) | Conditions | Pertinent sampling comments |

## TAYLORSVILLE LAKE ANGLER ATTITUDE SURVEY 2020

(Based on 469 surveys)
16. Have you been surveyed this year? Yes - stop survey No - continue
17. Name $\qquad$ and Zip Code $\qquad$
18. On average, how many times do you fish Taylorsville Lake in a year? ( $n=455$ )

First time 4.0\% 1 to 4 5.7\% 5 to 10 24.0\% More than 10 66.3\%
19. Which species of fish do you fish for at Taylorsville Lake (check all that apply)? ( $\mathrm{n}=469$ )

Bass 28.8\% Crappie 44.3\% Hybrid Striped Bass 7.7\% White Bass 4.9\% Channel Catfish 17.7\%
Blue Catfish 17.3\% Bluegill 6.8\% Saugeye 8.3\% Other 4.3\%
20. Which one species do you fish for most at Taylorsville Lake (check only one)? ( $\mathrm{n}=469$ )

Bass 26.0\% Crappie 40.9\% Hybrid Striped Bass 4.7\% White Bass 1.1\% Channel Catfish 8.3\%
Blue Catfish 6.8\% Bluegill 4.7\% Saugeye 2.8\% Other 4.7\%

## -Answer the following questions for each species you fish for - (see question 4)

## Bass Anglers

21. In general, what level of satisfaction or dissatisfaction do you have with bass fishing at Taylorsville Lake? ( $\mathrm{n}=132$ ) Very satisfied 93.9\% Somewhat satisfied 3.1\% Neutral 3.0\% Somewhat dissatisfied 0.0\% Very dissatisfied 0.0\%

6a. If you responded with very or somewhat satisfied in question (6) - What is the single most important reason for your Satisfaction? ( $\mathrm{n}=124$ )
Number of fish 74.2\% Size of fish 25.8\%

6b. If you responded with somewhat or very dissatisfied in question (6) - What is the single most important reason for your Dissatisfaction? $(n=0)$
22. Do you fish in any bass tournaments on Taylorsville Lake? ( $\mathrm{n}=129$ ) Yes 48.1\% No 51.9\%

## Crappie Anglers

23. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Taylorsville Lake? ( $\mathrm{n}=205$ ) Very satisfied 99.0\% Somewhat satisfied 0.5\% Neutral 0.5\% Somewhat dissatisfied 0.0\%
Very dissatisfied 0.0\%
8a. If you responded with very or somewhat satisfied in question (8) - What is the single most important reason for your
Satisfaction? ( $n=204$ )
Number of fish 55.9\% Size of fish 44.1\%
8b. If you responded with somewhat or very dissatisfied in question (8) - What is the single most important reason for your Dissatisfaction? ( $n=0$ )

## White Bass Anglers

24. In general, what level of satisfaction or dissatisfaction do you have with white bass fishing at Taylorsville Lake? ( $\mathrm{n}=22$ ) Very satisfied 31.8\% Somewhat satisfied 31.8\% Neutral 36.4\% Somewhat dissatisfied 0.0\% Very dissatisfied 0.0\%

9a. If you responded with very or somewhat satisfied in question (9) - What is the single most important reason for your Satisfaction? ( $n=14$ )
Number of fish 92.9\% Size of fish 7.1\%
9b. If you responded with somewhat or very dissatisfied in question (9) - What is the single most important reason for your Dissatisfaction? $(n=0)$

## Hybrid Striped Bass Anglers

25. In general, what level of satisfaction or dissatisfaction do you have with hybrid striped bass fishing at Taylorsville Lake? ( $\mathrm{n}=34$ ) Very satisfied 23.5\% Somewhat satisfied 67.7\% Neutral 2.9\% Somewhat dissatisfied 0.0\%
Very dissatisfied 5.9\%

10a. If you responded with very or somewhat satisfied in question (10) - What is the single most important reason for your Satisfaction? $(\mathrm{n}=30)$
Number of fish 56.7\% Size of fish 40.0\% Other 3.3\%
10b. If you responded with somewhat or very dissatisfied in question (10) - What is the single most important reason for your Dissatisfaction? $(n=2)$
Number of fish 100.0\%

## Channel Catfish Anglers

26. In general, what level of satisfaction or dissatisfaction do you have with channel catfish fishing at Taylorsville Lake? ( $\mathrm{n}=82$ ) Very satisfied 97.6\% Somewhat satisfied 2.4\% Neutral 0.0\% Somewhat dissatisfied 0.0\%
Very dissatisfied 0.0\%
11a. If you responded with very or somewhat satisfied in question (11) - What is the single most important reason for your Satisfaction? ( $n=79$ )
Number of fish 48.1\% Size of fish 51.9\%
11b. If you responded with somewhat or very dissatisfied in question (11) - What is the single most important reason for your Dissatisfaction? $(\mathrm{n}=0)$

## Blue Catfish Anglers

27. In general, what level of satisfaction or dissatisfaction do you have with blue catfish fishing at Taylorsville Lake? ( $n=79$ ) Very satisfied 93.7\% Somewhat satisfied 2.5\% Neutral 3.8\% Somewhat dissatisfied 0.0\%
Very dissatisfied 0.0\%
12a. If you responded with very or somewhat satisfied in question (12) - What is the single most important reason for your Satisfaction? ( $n=76$ )
Number of fish 43.4\% Size of fish 56.6\%

12b. If you responded with very or somewhat dissatisfied in question (12) - What is the single most important reason for your Dissatisfaction? $(\mathrm{n}=0)$

## All Anglers

28. In general, are you satisfied with the current size and creel limits on Taylorsville Lake? ( $\mathrm{n}=448$ ) Yes $\mathbf{7 9 . 9} \% \quad$ No $\mathbf{2 0 . 1} \%$

13a. If "no", which species are you dissatisfied with and what size and creel limits would you prefer?
Crappie Size Limit ( $n=90$ ) 9 inches 1.1\% 10 inches 7.8\% 11 inches 91.1\%
Crappie Creel Limit ( $\mathrm{n}=90$ ) 10 fish 28.8\% 15 fish 64.4\% 20 fish 6.8\%

# Beaver Lake Angler Attitude Survey 2020 

(based on 222 surveys)

1. On average how many times do you fish at Beaver Lake in a year? $(\mathrm{n}=212)$ First time: $\mathbf{8 . 5 \%} \quad 1$ to $4: \mathbf{1 5 . 1 \%} \quad 5$ to 10: $\mathbf{3 1 . 6 \%} \quad$ More than 10: $\mathbf{4 4 . 8 \%}$
2. Which species of fish do you fish for at Beaver Lake (circle all that apply)? ( $\mathrm{n}=222$ )

Bass 32.4\% Crappie 18.5\% Bluegill 46.0\% Redear Sunfish 24.3\% Catfish 23.9\% Other 5.0\%
3. Which one species do you fish for the most at Beaver Lake (circle only one)? ( $n=222$ ) Bass 27.9\% Crappie 8.1\% Bluegill 41.4\% Redear Sunfish 1.8\% Catfish 16.2\% Other 4.5\%
-Answer the following questions for each species you fish for - (see question 2)

## Bass Anglers

4. In general, what level of satisfaction or dissatisfaction do you have with bass fishing at Beaver Lake? ( $\mathrm{n}=71$ )
Very satisfied 53.5\% Somewhat satisfied 29.6\% Neutral 15.5\% Somewhat dissatisfied 1.4\% Very dissatisfied 0.0\%

4a. If you responded with very or somewhat satisfied in question (4) - What is the single most important reason for your Satisfaction? ( $\mathrm{n}=59$ )
Number of fish 93.2\% Size of fish 6.8\%
4b. If you responded with somewhat or very dissatisfied in question (4) - What is the single most important reason for your Dissatisfaction? $(n=1)$
Size of fish 100.0\%

## Crappie Anglers

5. In general, what level of satisfaction or dissatisfaction do you have with crappie fishing at Beaver Lake? ( $\mathrm{n}=37$ )
Very satisfied 21.6\% Somewhat satisfied 59.5\% Neutral 13.5\% Somewhat dissatisfied 5.4\%
Very dissatisfied 0.0\%
5a. If you responded with very or somewhat satisfied in question (5) - What is the single most important reason for your Satisfaction? ( $\mathrm{n}=30$ )
Number of fish 46.7\% Size of fish 50.0\% Other 3.3\%
5b. If you responded with somewhat or very dissatisfied in question (5) - What is the single most important reason for your Dissatisfaction? ( $n=2$ )
Number of fish 50.0\% Size of fish 50.0\%

## Bluegill Anglers

6. In general, what level of satisfaction or dissatisfaction do you have with bluegill fishing at Beaver Lake? ( $\mathrm{n}=98$ )
Very satisfied 68.4\% Somewhat satisfied 23.5\% Neutral 8.1\% Somewhat dissatisfied 0.0\%
Very dissatisfied 0.0\%
6a. If you responded with very or somewhat satisfied in question (6) - What is the single most important reason for your Satisfaction? $(\mathrm{n}=90)$
Number of fish 94.4\% Size of fish 5.6\%
6b. If you responded with somewhat or very dissatisfied in question (6) - What is the single most important reason for your Dissatisfaction? $(\mathrm{n}=0)$

## Redear Sunfish Anglers

7. In general, what level of satisfaction or dissatisfaction do you have with redear sunfish fishing at Beaver Lake? ( $\mathrm{n}=52$ )
Very satisfied 59.6\% Somewhat satisfied 30.8\% Neutral 9.6\% Somewhat dissatisfied 0.0\%
Very dissatisfied 0.0\%
7a. If you responded with very or somewhat satisfied in question (7) - What is the single most important reason for your Satisfaction? $(n=46)$
Number of fish 60.9\% Size of fish 39.1\%
7b. If you responded with somewhat or very dissatisfied in question (7) - What is the single most important reason for your Dissatisfaction? $(\mathrm{n}=0)$

## Catfish Anglers

8. In general, what level of satisfaction or dissatisfaction do you have with catfish fishing at Beaver Lake? ( $\mathrm{n}=51$ )
Very satisfied 70.6\% Somewhat satisfied 17.6\% Neutral 7.8\% Somewhat dissatisfied 3.9\% Very dissatisfied 0.0\%

8a. If you responded with very or somewhat satisfied in question (8) - What is the single most important reason for your Satisfaction? $(n=45)$
Number of fish 46.7\% Size of fish 53.3\%
8b. If you responded with somewhat or very dissatisfied in question (8) - What is the single most important reason for your Dissatisfaction? $(\mathrm{n}=2)$ Number of fish 100.0\%

## All Anglers

9. In general, are you satisfied with the current size and creel limits at Beaver Lake? ( $\mathrm{n}=208$ ) Yes 98.1\% No 1.9\%

9a. If "no", which species are you dissatisfied with and what size and creel limits would you prefer? Largemouth bass slot limit ( $\mathrm{n}=2$ ) Crappie 10 inch size limit ( $\mathrm{n}=1$ )
10. Would you support a regulation change at Beaver Lake that would allow the harvest of largemouth bass less than 12 inches? ( $\mathrm{n}=208$ ) Yes 82.2\% No 10.6\% Neutral 7.2\%
11. If it was legal, would you harvest largemouth bass less than 12 inches at Beaver Lake? ( $n=205$ ) Yes 72.7\% No 19.0\% Neutral 8.3\%
12. In general, what level of satisfaction or dissatisfaction do you have with the current facilities (parking lot, boat ramp, fishing pier, courtesy dock) at Beaver Lake? ( $\mathrm{n}=208$ ) Very satisfied 40.9\% Somewhat satisfied 36.5\% Neutral 12.5\% Somewhat dissatisfied 7.2\% Very dissatisfied 2.9\%

12a. If you responded with somewhat or very dissatisfied in question (12) - What is the single most important reason for your Dissatisfaction? ( $\mathrm{n}=21$ ) Parking 4.8\% Boat Ramp 85.7\% Other 9.5\%

Table 68. Length distribution and CPUE (fish/hr) of largemouth bass collected in 2.0 hours of 15 -minute electrofishing runs for black bass in Benjy Kinman Lake during May 2020; numbers in parentheses are standard errors.

# NORTHEASTERN FISHERY DISTRICT 

Project 1: Lake and Tailwaters Fishery Surveys

## FINDINGS

All sampling conditions can be found in Table 1.

## Cave Run Lake (8,720a)

Muskellunge sampling
On March 24-25, the upper, middle and lower sections of Cave Run Lake were diurnally electrofished for assessment of the muskellunge population. In total, 77 fish were collected ranging in size from 13.0 to 48.0 in (Table 2). Relative weights ( $\mathrm{W}_{\mathrm{r}}$ ) ranged from the lower 80 's to low 90 's and all values were within the normal historical range with the exception of the larger-sized fish which were slightly less than the historical average (Table 3). Muskellunge clip information was also collected in order to determine length and weight at age values (Table 4). Of the 77 fish collected, 66 had clip marks. Clip data indicated that fish cross into the 36.0 -in size range by age 4 or 5 , which is similar to previous studies done on length at age relationships. The total assessment rating of muskellunge on Cave Run Lake in 2020 was "Poor" (Table 5).

Black bass sampling (Spring)
Black bass were not sampled in 2020 because of Covid19 personnel restrictions at the time of the sampling.

## Crappie sampling

Over the last week of October, crappie were sampled in the upper third (8 nets for 3 nights) and lower two-thirds (7 nets for 3 nights) of Cave Run Lake with trap nets. In 45 net-nights, 1377 crappie were collected (Table 6). Of these fish, $91 \%$ came from the upper section and the remaining $9 \%$ came from the lower two-thirds of the lake. PSD and $\mathrm{RSD}_{10}$ showed the vast majority of the fish over 5.0 in were of smaller size (Table 7). $\mathrm{W}_{\mathrm{r}}$ values were slightly higher in the lower two-thirds of the lake (Table 8). In 2020, a subsample of fish were collected to show age and growth characteristics of both black and white crappie. On average, white crappie reached 10.0 in by their $6^{\text {th }}$ year (Table 9), but some fish could reach this mark by their $3^{\text {rd }}$ year (Table 10). Black crappie showed slightly slower growth, reaching 10.0 in on average in their $8^{\text {th }}$ year (Table 11), but the age frequency table (Table 12) showed significant variability in these trends. The overall assessment rating for white crappie on Cave Run Lake was "Good" (Table 13).

## Grayson Lake (1,512a)

Black bass sampling (Spring/Fall)
Black bass were not sampled in 2020 because of Covid19 personnel restrictions at the time of the sampling.
In September, Grayson Lake was nocturnally electrofished for determination of spawning strength of largemouth bass. Indices of year class strength for largemouth bass continue to be on the high end (Table 14) and the lake continued to show no need for stocking of young of year largemouth bass in 2020.

## Crappie sampling

On 22 October, the upper end of Grayson Lake was diurnally electrofished for assessment of the crappie population. In 1.5 hours of sampling, 187 fish were sampled, of which $89 \%$ were white crappie and $11 \%$ were black crappie (Table 15). Similar to Cave Run Lake, the majority of the fish over 5.0 in . were of smaller size (Table 16) and $\mathrm{W}_{\mathrm{r}}$ values ranged from the mid-70 to mid-80's (Table 17). A subsample of fish were collected for determination of age and growth characteristics, which showed a slower growing population (Table 18) with the majority of the fish under 10.0 in (Table 19). The overall assessment rating of the white crappie population at Grayson Lake was "Fair" (Table 20).

## Hybrid Striped Bass Sampling

Towards the end of October, Grayson Lake was sampled for assessment of the hybrid striped bass population. In 11 net-nights, 69 fish were sampled (Table 21). $\mathrm{W}_{\mathrm{r}}$ values were all in the low to mid 80s and were within the historical range of previous samples (Table 22). On average, the fish reach 20.0 in by their $4^{\text {th }}$ year (Table 23) and exhibit a good spread in terms of age frequency (Table 24). The overall assessment of the hybrid striped bass population at Grayson Lake was "Good" (Table 25). Assessment ranges used were specifically developed (and regularly updated) for Grayson Lake, and sampling was conducted with 125-foot, five-panel gill nets.

## Greenbo Lake (181a)

## Black bass sampling (Fall)

On 24 September, Greenbo Lake was nocturnally electrofished to assess the bass population. In total, 214 largemouth bass were collected ranging from 2.0 to 19.0 in (Table 26). Relative weights ( $\mathrm{W}_{\mathrm{r}}$ ) were in line with the average since 2007 in every size class (Table 27). The year class strength is down from recent years (Table 28), but stocking could not take place due to restrictions from Covid19.

## Miscellaneous

The spring sample was not attempted due to Covid19 and personnel restrictions. Hydrilla and Elodea are still present at Greenbo Lake. However, the grass carp have significantly cut back the amount of vegetation. Staff opted out of stocking grass carp in 2020. Reevaluation will take place before deciding if grass carp should be stocked in 2021.

## Lake Carnico (114a)

## Black bass sampling (Spring)

On 28 April, Lake Carnico was diurnally electrofished to assess the largemouth bass population. A total of 114 fish were collected ranging from 2.0 to 19.0 in (Table 29). The total catch rate has been on a downward trend for the past few years. The largest length group is still the $\geq 15.0$-in group (Table 30). The PSD and $\mathrm{RSD}_{15}$ values are down from the last two years but are still high in comparison to the past 15 years (Table 31). The overall largemouth bass assessment was rated as "Fair" (Table 32).

## Sunfish sampling (Summer)

On 26 May, Lake Carnico was diurnally electrofished to assess the sunfish population. A total of 242 bluegill were collected ranging from 2.0 to 6.0 in (Table 33). Bluegill overall numbers are high, however, the total catch is carried by the $3.0-$ to 5.9 -in class (Table 34). Bluegill PSD was extremely low (Table 35). Bluegill age and growth data showed slower growth rates, with it taking five years to reach 5.0 in on average (Table 36). The bluegill assessment was rated at "Poor" (Table 38). Redear sunfish were also collected and ranged in size from 2.0 to 7.0 in (Table 33). Although the number of stock-size redear that were caught was nearly double previous values, the PSD remained very low (Table 40). The redear showed slightly better growth than the bluegill, reaching almost 5.0 in on average in four years (Table 41). The overall redear assessment was rated as "Poor" this year (Table 43).

## Lake Reba (76a)

## Black bass sampling (Spring/Fall)

On 12 May, Lake Reba was diurnally electrofished for assessment of the largemouth bass population. While this date was 2-4 weeks later than our normal sampling time, temperatures were still within boundaries set in KDFWR's Standard Methods for Sampling. In total, 500 largemouth bass were sampled ranging in size from 3.0 to 21.0 in (Table 44). All size classes of fish sampled were above average with the exception of catch rates of fish $\geq 15.0$ in (Table 45). The PSD and $\operatorname{RSD}_{15}$ values were below average for the lake indicating a large number of smaller-sized fish (Table 46). In September, a subsample of largemouth bass were collected for an assessment of the age and growth structure of the fishery. This data showed strong growth with fish potentially reaching 12.0 inches in their
third year (Table 47). While growth rates and catch rates of smaller-sized bass were excellent, sub-par catch rates of larger-sized fish kept the assessment of this fishery in the "Good" range (Table 48).

Lake Reba was once again diurnally electrofished in the fall to collect indices related to spawning class strength, $\mathrm{W}_{\mathrm{r}}$ values and collection of fish for age and growth assessment. In total, 444 fish were collected (Table 49), and $\mathrm{W}_{\mathrm{r}}$ values were within historical ranges for the lake (Table 50). Additionally, a strong 2020 year class of fish was observed so the lake was not stocked in 2020 (Table 51).

## Smoky Valley (36a)

## Black bass sampling (Spring/Fall)

On 11 May, Smoky Valley Lake was diurnally electrofished for assessment of the largemouth bass fishery. Similar to the largemouth bass sample on Lake Reba, the timing of this sample was 2-4 weeks later than normal, but temperatures were still within the range outlined by KDFWR's Standard Methods for Sampling. In total, 152 fish were captured ranging in size from 2.0 to 15.0 in (Table 52). Catch rates were almost across the board lower than the ten-year average for all length groups of largemouth bass (Table 53). PSD and $\mathrm{RSD}_{15}$ values for largemouth bass were similar to previous years indicating similar proportions of large to small fish (Table 54). In September, a subsample of largemouth bass was collected for an assessment of the age and growth structure of the fishery. This data showed moderate growth with fish reaching 12.0 inches in their $4^{\text {th }}$ year (Table 55). Lower catch rates of larger fish resulted in a "Fair" overall assessment of the largemouth bass population (Table 56).

Smoky Valley Lake was once again diurnally electrofished in the fall to collect indices related to $\mathrm{W}_{\mathrm{r}}$ values and for collection of fish for age and growth assessment. In total, 168 fish were collected (Table 57), and $\mathrm{W}_{\mathrm{r}}$ values were similar to historical averages for the lake or slightly higher (Table 58).

## Lake Wilgreen (131a)

## Sunfish sampling (Summer)

On 02 June, Lake Wilgreen was diurnally electrofished for assessment of the sunfish population. In total, 681 bluegill and 3 redear sunfish were sampled in 1.0 hour of electrofishing (Table 59). Catch rates were almost across the board higher than the 20-year average for all length groups of bluegill (the exception was the catch rate of fish over 8.0 in, which was lower; Table 60 ). PSD and $\mathrm{RSD}_{8}$ values for bluegill indicated a lower number of bigger fish when compared to the number of small fish (Table 61). No fish were collected for determination of $\mathrm{RSD}_{8}$. A subsample of bluegill were collected for an assessment of the age and growth structure of the fishery. This data showed moderate growth with fish reaching 6.0 inches in their $3^{\text {rd }}$ or $4^{\text {th }}$ year (Tables 62 and 63). Increases in the growth parameters resulted in a "Good" rating in the overall assessment of the bluegill population (Table 64).

Table 1: Yearly summary of sampling conditions by waterbody, species sampled and date.

| Water body | Species | Date <br> $(\mathbf{2 0 2 0})$ | Time <br> $\mathbf{2 4 h r}$ | Gear | Weather | Water <br> Temp ( ${ }^{\circ}$ F) | Water <br> level | Secchi <br> (in) | Conditions | Pertinent sampling comments |

# SOUTHEASTERN FISHERY DISTRICT 

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Conditions encountered during sampling at southeastern district lakes are listed in Table 1.

## Lake Cumberland (50,250 acres)

Lake levels in Lake Cumberland rose to 705 msl in 2013 and 723 msl in 2014 with the completion of repairs to Wolf Creek Dam. Sampling completed after 2013 was conducted in areas that were sampled prior to 2007. Samples from 2007-2012 were conducted in areas farther downstream in the embayments due to reduced water levels during dam repairs; therefore, any comparisons of the 2007-2012 data should be interpreted accordingly.

## Black Bass Sampling (Spring)

Covid19 restrictions delayed spring sampling, and water temperatures and conditions were not favorable for the spring bass sample on Lake Cumberland.

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted in the Fishing Creek embayment during 6 October 2020 to index the largemouth bass year class strength (Tables 2 and 3). Catch rates of age-0 largemouth bass were higher in 2020 than in 2019, but the average size of age-0 bass was the lowest observed in the last 10 years (Table 3). Table 4 compares the CPUE of age-0 largemouth bass in Lake Cumberland to other SEFD lakes sampled in fall 2020. Relative weight (Wr) values for largemouth bass and spotted bass collected during October sampling are shown in Table 5. Table 6 compares Wr values for black bass in Lake Cumberland to other SEFD lakes sampled in fall 2020.

## Walleye and White Bass Sampling

Gill nets were used in November 2020 to evaluate the walleye and white bass populations in the Jamestown/Bugwood, Conley Bottom, and Waitsboro/Burnside areas of Lake Cumberland. A total of 181 walleye were captured in 30 net-nights for a catch rate of 6.0 fish $/ \mathrm{nn}$. Length frequency and CPUE of walleye is shown in Table 7. Walleye ranged from 9.0-22.0 in, with the mode being the 17.0 -in class ( 38 fish). None of the catch rate management objectives for walleye were met during the 2020 sampling (Table 8). Mean length of age-2+ walleye at capture ( 18.8 in ) met the growth objective of 18.0 in (Table 8). Age-growth data for male and female walleye are shown in Tables 9 and 10, respectively. The age-growth for both sexes combined is shown in Table 11. Seven year-classes were represented in the catch, with the 2017 year class (age-3; 27\%) being most abundant, which coincided with the increased (pulsed) stocking rate of 12.0 fish/acre in 2017 (Table 12). The walleye assessment score was 11 (rating=good; Table 13). Relative weight (Wr) values for walleye are shown in Table 14. The walleye population in Lake Cumberland had steadily improved following a fish die-off in 2009. During 2019, water quality in the lake in the late summer deteriorated, and although limited numbers of dead walleye were observed, results from 2020 sampling indicate that a larger-scale die-off occurred.

A total of 3 white bass were captured in 30 net-nights for a catch rate of 0.1 fish $/ \mathrm{nn}$. Length frequency and CPUE of white bass is shown in Table 7. White bass ranged from 8.0-14.0 in. Due to the low number of fish collected, additional age-growth analyses were not performed. Relative weight (Wr) values for white bass are in Table 14.

Striped bass were also recorded during walleye gill netting. Thirty net-nights captured 83 striped bass for a catch rate of 2.8 fish $/ \mathrm{nn}$. Length-frequency and CPUE of striped bass are shown in Table 7. Striped bass ranged from 7.0 to 28.0 in with the mode being the 9.0 -in class (18 fish). The age-growth data for striped bass collected during 2020 is shown in Table 15. Six year-classes were represented in the catch, with the 2020 (age-0) year class being the most abundant (45\%; Table 16). The 2017 year class (age-3) remains strong, accounting for an additional $24 \%$ of the catch (Table 16). Relative weight (Wr) values were good for striped bass <20.0 in, but condition values decreased as fish grew larger (Table 14).

## Cumberland Tailwater

## Trout Sampling (Fall)

Nocturnal electrofishing sampling was conducted November 1 and 22020 to assess the trout population in the Lake Cumberland tailwater. Electrofishing was completed in six different areas of the tailwater. Standardized sampling was not conducted at Crocus Creek in 2020 due to boat issues. Table 17 has the length-frequency and CPUE for the three trout species that were collected in each area. Cutthroat trout, which were first introduced in March 2019 and received an additional stocking of 500 fish in 2020, were not observed during the fall sampling. Brook trout were observed in low numbers during the sample at one location. Catch rates of rainbow trout across all size groups increased during 2020 (Table 18). Brown trout catch rates continue to decline and remain well below the 26-year average for the tailwater (Table 19). Relative weight (Wr) values for each trout species is shown in Table 20.

## Laurel River Lake (6,060 acres)

## Black Bass Sampling (Spring)

Electrofishing sampling was conducted during May and June 2020 to assess the black bass population in Laurel River Lake. Electrofishing was conducted in four areas of the lake: 1) dam, 2) Spruce Creek, 3) Laurel River arm, and 4) upper Craigs Creek. Length-frequency and CPUE of the three black bass species collected in each area is shown in Table 21. The catch-per-hour (by area and length group) of the three black bass species are shown in Tables 22-25. Overall catch rates for largemouth bass increased slightly in 2020, which was due to increases in catch rates of fish less than 12.0 in (Table 23). Catch rates of $\geq 15.0$-in largemouth bass decreased in 2020, which marks the third year of declining catches of largemouth bass over 15.0 in (Table 23). Overall catch rates of spotted bass increased in 2020 (Table 24). Smallmouth bass catch rates increased in 2020, and there were increases in the catch rates of smallmouth bass less than 11.0 in (Table 25). Table 26 compares the catch-per-hour by length group of black bass in Laurel River Lake to other SEFD lakes sampled in spring 2020.

The largemouth bass population met one of the four catch rate objectives, with the CPUE of age- 1 bass ( $22.7 \mathrm{fish} / \mathrm{hr}$ ) exceeding the objective of $10.0 \mathrm{fish} / \mathrm{hr}$ (Table 27). This is the second consecutive year that the largemouth bass age1 CPUE objective was exceeded and should help to bolster the population. Spotted bass met one of the three catch rate management objectives, with the catch rate of fish over 14.0 in exceeding the objective (Table 28). The smallmouth bass population met one of the catch rate management objectives, with the catch rate of fish over 14.0 in meeting the objective (Table 29).

Size structure values were down for all three species in 2020 at Laurel River Lake. Largemouth bass exhibited moderate size structure, having a PSD value of 44 and an RSD $_{15}$ value of 20 (Table 30). Smallmouth and spotted bass also had a moderate size structure, with smallmouth bass having a PSD value of 43 and an RSD 14 value of 43, and the spotted bass population having a PSD of 34 and an $\mathrm{RSD}_{14}$ of 9 (Table 30). Table 31 compares the size structure values of black bass populations in Laurel River Lake to other SEFD lakes sampled in 2020.

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted in the Laurel River arm on 30 September 2020 to index largemouth bass year class strength (Tables 32 and 33). Age-0 catch rates in 2020 were slightly lower than rates observed in 2019, and were lower than the 19-year average for the lake (Table 33). Table 4 compares the CPUE of age-0 largemouth bass in Laurel River Lake to other SEFD lakes sampled in fall 2020. Relative weight (Wr) values for largemouth and spotted bass collected during September sampling are shown in Table 34. Table 6 compares Wr values for black bass in Laurel River Lake to other SEFD lakes sampled in fall 2020.

## Cedar Creek Lake (784 acres; Lincoln Co.)

## Black Bass Sampling (Spring)

Diurnal electrofishing was conducted on 12 May 2020 to assess the largemouth bass population in Cedar Creek Lake. The length-frequency and CPUE of largemouth bass is shown in Table 35. Size structure of largemouth bass was good ( $\mathrm{PSD}=73$, $\mathrm{RSD}_{15}=41$; Table 36). Table 31 compares the size structure values of largemouth bass populations in Cedar Creek Lake to other SEFD lakes sampled in 2020. The catch-per-hour (by length group) of
largemouth bass for 2011-2020 is shown in Table 37. Overall catch rates of largemouth bass in Cedar Creek Lake decreased in 2020 (Table 37). Table 26 compares the catch-per-hour by length group of largemouth bass in Cedar Creek Lake to other SEFD lakes sampled in 2020. Three of the four CPUE management objectives were met or exceeded for the largemouth bass population, with the catch rate of fish greater than 20.0 in ( $3.3 \mathrm{fish} / \mathrm{hr}$ ) failing to meet the objective of $4.0 \mathrm{fish} / \mathrm{hr}$ (Table 38). The mean length of age- 3 bass at capture ( 12.4 in ) met the growth objective of 11.5 in (Table 38).

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted on 28 September 2020 to index the largemouth bass year-class strength (Tables 39 and 40). Although catch rates of age-0 largemouth bass in 2020 were lower than in 2019, the catch rates were higher than the 17-year lake average (Table 40). Table 4 compares the CPUE of age- 0 largemouth bass in Cedar Creek Lake to other SEFD lakes sampled in fall 2020. Relative weight (Wr) values for largemouth bass are found in Table 41. Table 6 compares Wr values for largemouth bass in Cedar Creek Lake to other SEFD lakes sampled in fall 2020.

Age-growth data from largemouth bass collected in 2020 from Cedar Creek Lake is shown in Table 42. Growth rates for largemouth bass in Cedar Creek Lake improved, with bass reaching 12.4 in by age-3. Previous growth rates for largemouth bass were slightly lower, with bass attaining lengths of 12.0 in by age-3.

## Bluegill/Redear Sunfish Sampling

Due to Covid19 restrictions, spring sampling was delayed and vegetation on Cedar Creek Lake created poor sampling conditions.

## Wood Creek Lake (625 acres; Laurel Co.)

## Black Bass Sampling (Spring)

Diurnal electrofishing was conducted on 13 May 2020 in the Pump Station and Dock areas of Wood Creek Lake to assess the black bass population. Length frequency and CPUE for black bass are shown in Table 43. The size structure for largemouth and spotted bass was poor, with largemouth bass having a PSD value of $25\left(\mathrm{RSD}_{15}=10\right)$ and spotted bass having a PSD of $27\left(\mathrm{RSD}_{14}=0\right.$; Table 44$)$. Table 31 compares the size structure values of black bass populations in Wood Creek Lake to other SEFD lakes sampled in 2020. Catch-per-hour (by length group) for largemouth and spotted bass are shown in Tables 45 and 46, respectively. Although the overall largemouth bass catch rate decreased in 2020, catch rates of fish larger than 15.0 in increased (Table 45). The spotted bass catch rate increased in 2020 due to increasing numbers of fish in the 8.0- to 13.9-in range (Table 46). Table 26 compares the catch-per-hour by length group of black bass in Wood Creek Lake to other SEFD lakes sampled in 2020. A largemouth bass population assessment is shown in Table 47. Three of the four catch rate management objectives were met for the largemouth bass population, with catch rates of fish greater than 15.0 in ( $16.7 \mathrm{fish} / \mathrm{hr}$ ) just failing to meet the objective of 17.0 fish/hr (Table 47).

## Black Bass Sampling (Fall)

Diurnal electrofishing was conducted on 29 September 2020 in the Pump Station and Dock areas of Wood Creek Lake to index largemouth bass year class strength (Tables 48 and 49). Catch rates of age-0 largemouth bass in 2020 were consistent with catch rates observed in 2018 and 2019 (Table 49). Table 4 compares the CPUE of age- 0 largemouth bass in Wood Creek Lake to other SEFD lakes sampled in fall 2020. Relative weight values for largemouth and spotted bass in Wood Creek are shown in Table 50. Table 6 compares Wr values for black bass in Wood Creek Lake to other SEFD lakes sampled in fall 2020.

Table 1. Summary of sampling conditions by waterbody, species sampled, and date for the Southeastern Fisheries District in 2020.

| Water body Location | Species | Date | $\begin{gathered} \text { Time } \\ (24 \mathrm{hr}) \\ \hline \end{gathered}$ | Gear | Weather | Water temp. F | Water level | Secchi <br> (in) | Conditions | Pertinent sampling comments |

## EASTERN FISHERY DISTRICT

Project 1: Lake and Tailwater Fishery Surveys

## FINDINGS

Due to Covid19 restrictions and staffing considerations, most spring sampling (bass in particular) had to be cancelled for 2020. We were able to resume fall data collection following appropriate safety guidelines.

Table 1 shows sampling conditions by water body for eastern fishery district lakes in 2020.

## Buckhorn Lake

## Muskellunge

Diurnal electrofishing was conducted during early-February (Tables 2-4). A total of 20 fish were collected from $12.7-40.2$ in (Table 2) with the largest fish weighing 19.58 lb . Relative weight ( $\mathrm{Wr)}$ values by length group are listed in Table 3. Relative weight increased with increasing fish size. An assessment rating of "Good" was observed for the fishery (Table 4). Please note that the 2017-2019 sample events were conducted during poor conditions. Due to Covid19 restrictions and staffing considerations, hatcheries were not able to produce enough muskellunge for stocking in 2020. Fish from the last stocking (2019) did not have any wire tag or fin clip for identification, but future stockings should include an appropriate identification mark. Stocking sites usually include the marina and Trace Fork boat ramps. The normal stocking number is 405 fish/yr; however, in 2018 the lake only received 150 fish.

## Black bass

Spring electrofishing data from 2003-2019 is shown in Table 5.
Fall nocturnal electrofishing was completed for black bass to determine length frequency, age and growth and year class strength (Tables 6-8). This fall, lake turn-over prevented sampling efforts from being effective in the upper lake sections, reflecting a lower than usual CPUE (Table 6). Age growth data from largemouth bass collected in 2020 from Buckhorn Lake is shown in Table 7. Growth rates for largemouth bass have slowed, with bass only reaching 11.7 in by age-3. Previous growth rates for largemouth bass were slightly higher with age- 3 fish attaining lengths of 13.3 inches in 2009 and 12.1 inches in 2014. Length-frequency data shows that the highest density of fish collected in the fall 2020 sample ranged from 9.0 to 12.0 inches in length (Table 6). Catch rates of age-0 largemouth bass ( $50.9 \mathrm{fish} / \mathrm{hr}$ ) decreased in 2020 in relation to the catch rates observed over the last several years. Mean age- 0 largemouth bass length ( 4.8 in ) was slightly above average. Recruitment has been good in recent years with above-average CPUE observed for age-0 fish from 2016-2019.

Additional lake stockings in 2020 included 24,600 redear sunfish (1.2 in) during September. Approximately 3,200 rainbow trout ( $8.0-12.0 \mathrm{in}$ ) were stocked in the tailwater during the months of May-June and October-November.

## Carr Creek Lake

## Black bass

Spring electrofishing data from 2002-2019 is shown in Table 9.
Electrofishing was completed in September and October for black bass (Tables 10 and 11). Hydrilla expanded significantly at Carr Creek Lake in 2020, especially in the upper lake arms. Zebra mussels first started showing up in 2019 and the water stayed clear for the majority of the spring and summer in 2020 , furthering the expansion of the hydrilla. Length frequency for black bass over 12.0 in was low (Table 10). The expansion of hydrilla limited the ability to electrofish shoreline habitat in the fall, likely reducing catch rates of larger fish. Age-0 CPUE (50.9 fish $/ \mathrm{hr}$ ) was observed to be above average ( $26.2 \mathrm{fish} / \mathrm{hr}$; Table 11). Mean age-0 largemouth bass length (4.8 in) was
also slightly above average. Fall YOY sampling suggests a very good largemouth bass year class in 2020.
Increased hydrilla densities most likely played a part in the higher recruitment of age-0 largemouth bass.

## Walleye

Diurnal electrofishing samples were collected in the early spring for walleye (Tables 12-14). Additionally, during this sampling effort, broodfish were collected for Minor Clark Fish Hatchery. Over multiple days sampling for broodfish, a total of 87 walleye were sampled (Table 12). The majority of fish were in the $18.0-$ to 22.0 -in size class (Table 12). The total relative weight value was 95 (Table 14) and is good considering that a large proportion were males. This parameter can be influenced by the number of males collected. The $\log _{10}$ length-weight equation for walleye during 2020 sampling was $-3.60+3.13\left(\log _{10}\right.$ length). A typical walleye stocking for Carr Creek Lake is 35,000 (1.2 in) fish. Staff from Minor Clark Fish Hatchery experimented with growing out walleye fry to larger sizes in 2020. Some of the resulting pond-reared walleye were stocked at Carr Creek Lake in August, including 521 (7.0 in), 11,505 (4.4 in) and 6,453 (3.3 in) fingerlings. The stocking was split between the Litt Carr and Marina boat ramps.

## Crappie

Early spring electrofishing was used to collect black and white crappie (Tables 15-20). The fishery is managed under a 9.0 -in minimum size limit. The total CPUE has fluctuated significantly from year to year (Table 16), but crappie populations can be cyclic in numbers. Tables 18 and 19 contain age and growth data for black and white crappie. All age groups from 1-9 (white) and 1-10 (black) were represented in the age and growth data. Tentative scheduling will include early spring electrofishing in 2022.

Grass carp were stocked jointly by KDFWR and the USACE in an effort to help control hydrilla growth. September grass carp stockings totaled 200 fish at 10.0 - to 12.0 -in average length. A redear sunfish stocking program was initiated in October 2018 and stocking continued in 2019 and 2020 with 14,200 (1.2 in) fish stocked in September of each year. Tailwater stockings included 3,500 (total) rainbow trout during the months of May, June, October and November.

During 2019, zebra mussels were documented for the first time in the lake, and they became prolific in number by year end. For 2020, the zebra mussel population peaked by early summer and numbers looked to have significantly reduced by fall. This follows several other recent invasive species introductions of purple loosestrife (2013), hydrilla (2008), and alewife (2000) to Carr Creek Lake.

## Cranks Creek Lake

## Black bass

Spring electrofishing data from 2000-2019 is shown in Table 21.
Fall nocturnal electrofishing was completed in October for black bass to determine length frequency and year class strength (Tables 22 and 23). Age-0 CPUE ( 43.2 fish/hr) was observed to be slightly below average. Mean age-0 length ( 4.3 in ) was average (Table 23). This lake's weighted regression shows that the YOY year class is often density dependent. Stocking advanced fingerlings in the fall does not always benefit the year class. This is an extremely clear, relatively infertile lake. Past efforts to apply fertilizer have had little to no effect due to water chemistry. Largemouth bass are the dominant black bass species and this lake continues to produce some trophysize fish.

Approximately 3,000 rainbow trout (total) were stocked in the lake in January and October. Channel catfish $(2,640)$ were also stocked. No vegetation controls were utilized in 2020; however, herbicides have been used when needed in the past and future work may include a low-rate stocking of grass carp.

## Dewey Lake

## Black bass

Spring electrofishing data from 1987-2019 is shown in Table 24.
Fall nocturnal electrofishing was completed in October for black bass to determine length frequency and year class strength (Tables 25 and 26). The year class strength model indicated that 2020 was a below-average recruitment year for young-of-year largemouth bass. Age-0 CPUE ( 11.6 fish $/ \mathrm{hr}$ ) was well below the lake average ( $43.4 \mathrm{fish} / \mathrm{hr}$ ). Sampling conditions in the upper portion of the lake were poor and visibility was limited due to muddy water. Recruitment has been consistently low since 2010. Supplemental age-0 fingerling bass were stocked in the fall from 2011-2017. Due to Covid19 and staffing restrictions, no supplemental bass were raised at the hatcheries for stocking in 2020. Dewey Lake lacks significant vegetation in the majority of the lake. EFD staff have increased habitat improvement efforts in a move to increase available cover.

## Crappie

Trap netting was conducted in the fall to sample black and white crappie (Tables 27-34). Total CPUE was 20.7 and 17.8 fish/nn for white and black crappie, respectively (Table 27). Age-3 white crappie (Table 31) and age-4 black crappie (Table 32) were the most numerous age classes for each species. The population assessment was "Good" for white crappie (Table 33) and "Fair" for black crappie (Table 34). Mean total length of age- 2 fish at capture was 7.8 in for white crappie (Table 33) and 6.5 in for black crappie (Table 34). Mean total length at age- 2 for either species failed to reach the 9.0 or 10.0 -in size desired for commonly used minimum size limits in Kentucky.

A total of 11,000 blue catfish (5.0-9.0 in) were stocked in October. Due to COVID-19 restrictions and staffing considerations, hatcheries were not able to produce enough muskellunge for stocking in 2020. Rainbow trout ( $1,000 / \mathrm{mo}$; 9.3-10.2 in) were stocked in the Dewey Lake tailwater in May, October, and November.

## Fishtrap Lake

## Black bass

During 2020, both spring and fall electrofishing samples were completed for black bass (Tables 35-40). Catch rates for all length groups increased in 2020 when compared to 2019 data (Table 36). PSD data showed a population skewed towards larger sizes (Table 37). The spring assessment was "Excellent" for largemouth bass (Table 38). This lake experienced an extreme drawdown of approximately 42 ft during the winter of 2016-2017 for hydraulic gate repairs in the dam. In 2017, following these repairs, largemouth bass had a spring assessment of "Fair" and in 2018 were not sampled. The most recent assessments suggest that recruitment of spring age-1 bass is improving. Mean age- 0 length ( 5.2 in ) in the fall was above the lake average ( 4.9 in ). The total CPUE of age- 0 ( $66.0 \mathrm{fish} / \mathrm{hr}$ ) and age- $0 \geq 5.0$ in fish ( 34.8 fish $/ \mathrm{hr}$ ) was well below the lake averages ( 105.3 and $50.0 \mathrm{fish} / \mathrm{hr}$, respectively). When fall age- 0 catch data suggests the need for stocking, advanced fingerlings for Fishtrap are held over-winter for stocking the following spring. Hold-over bass from 2019 were stocked in March 2020. Due to Covid19 restrictions and staffing considerations, hatcheries were not able to produce enough bass for stocking hold-overs in the spring of 2021.

## Walleye

Numerous (unsuccessful) attempts have been made in recent years to collect native walleye broodfish in the upper end of the lake with spring electrofishing. Very few anglers have reported catching walleye in the lake or above the lake in Levisa Fork River. Walleye stockings were discontinued in 2020.

A total of 11,430 blue catfish ( 7.5 in ) were stocked in the lake during October. A total of 23,106 hybrid striped bass ( 1.5 in ) were stocked in June. Rainbow trout ( 5,000 total) were stocked in the tailwater in May, June and October.

## Highsplint Lake

## Black bass

Spring diurnal electrofishing results for length distribution and CPUE are presented in Tables 41-43. The overall catch rate of bass ( $400.0 \mathrm{fish} / \mathrm{hr}$ ) was similar to 2012 (Table 42). Largemouth bass $<8.0$ in have decreased significantly while 12.0- to 14.9 -in bass have increased (Table 42). Bass PSD (26) is low and the population is dominated by fish in the 8.0 - to 11.9 -in range ( 254.0 fish $/ \mathrm{hr}$ ) with poor numbers of fish $\geq 15.0$ in ( $6.0 \mathrm{fish} / \mathrm{hr}$; Tables 42-43). This is an extremely clear lake with low fertility which will often develop a significant vegetation problem by late spring if left untreated.

Water quality readings were taken during spring 2020. It was determined that alkalinity ( $34.2 \mathrm{mg} / \mathrm{L}$ ) and hardness ( $102.7 \mathrm{mg} / \mathrm{L}$ ) readings were within appropriate levels for the lake to benefit from the addition of granular fertilizer. Often, this process will effectively shade lake vegetation by boosting phytoplankton/zooplankton levels. Two separate fertilizer applications during the month of May ( $50 \mathrm{lbs} / 2$ weeks) were successful at reducing secchi disk visibility from 332 in to 60 in . During spring of 2020, some herbicide was also applied to areas of the lake to limit aquatic plant and filamentous algae growth acting as unnecessary protection for small bass and bluegill and also limiting bank angler access.

Fish stockings in the lake for 2020 included rainbow trout in January $(1,750)$ and October $(1,000)$, and channel catfish (1,000; 7.1-in) in October.

During August 2012, a small portion of the lake was found to have a thermocline at approximately 27-35 ft with sufficient dissolved oxygen ( $4.55-5.45 \mathrm{ppm}$ ) and water temp ( $65-72 \mathrm{~F}$ ) for trout to survive. With rainbow trout being stocked in the lake, some holdover could occur and produce larger-size fish.

## Martins Fork Lake

## Black bass

Spring electrofishing data from 2003-2019 is shown in Table 44.
Fall 2020 length-frequency data shows that the highest density of largemouth bass fell in the 7.0 - to 11.0 -in range (Table 45). Age and growth studies showed that, on average, largemouth bass reach the 12.0 -in minimum size limit between age 4 and age 5 (Table 46). Growth rates for largemouth bass have slowed, with bass only reaching 10.1 in by age-3. Previous growth rates for largemouth bass were slightly higher with age-3 largemouth attaining lengths of 10.9 inches in 2014 and 11.8 inches in 2009. From 2016-2018, there were larger-than-average year classes of age-0 largemouth bass (Table 47). In 2020, the year class strength model indicated below-average recruitment for young-of-year largemouth bass ( $16.0 \mathrm{fish} / \mathrm{hr}$; Table 47). Due to Covid19 restrictions and staffing considerations, hatcheries were not able to produce enough bass for stocking in 2020.

## Walleye

During March, a day was utilized to electrofish for walleye broodfish; however, no adults were collected. The native strain walleye has been stocked annually since 2013. Walleye were collected during fall largemouth bass sampling; however, no large fish were observed (Table 45).

Martins Fork Lake was stocked with 8,022 native strain walleye ( 3.0 in ) in June. In addition, 6,700 redear sunfish (1.2 in.) were stocked in September. Channel catfish (4,900; 7.1 in ) were stocked in October. Rainbow trout (750 fish/mo) were stocked at the tailwater in May, June, October and November.

## Panbowl Lake

## Black bass

Diurnal electrofishing was conducted in May to assess the largemouth bass population. Length frequency and CPUE for largemouth bass is shown in Table 48. Catch per hour (by length group) for largemouth bass is shown in Table 49. Fish were sampled from approximately 5.0 to 19.0 in (Table 48). Smaller size ranges were more
numerous resulting in a marginal size structure (Table 50). High fishing pressure, due to the lake's location within the city of Jackson may likely be contributing to the low number of keeper fish (>12.0 in). During the 1990's to early-2000's, it was common to observe largemouth bass PSD values of 60-70.

A total of 3,000 rainbow trout ( 9.7 in ) were stocked in October. An additional 1,864 channel catfish ( 9.5 in) were stocked in September.

## Paintsville Lake

## Black bass

Spring electrofishing data from 1988-2019 is shown in Table 51.

Fall diurnal electrofishing was completed in late October to determine length frequency and year class strength of largemouth bass (Tables 52 and 53). Age-0 overall CPUE ( $71.2 \mathrm{fish} / \mathrm{hr}$ ) was average while age- $0 \geq 5.0$ in CPUE ( $6.0 \mathrm{fish} / \mathrm{hr}$ ) was well below average. Mean age-0 largemouth bass length ( 3.3 in ) was also below average.

The 12.0- to 15.0 -in slot length limit for largemouth bass was replaced with a minimum length limit of 12.0 in beginning 1 March 2019. The slot length regulation was in effect for 17 years (2002-2018). Bass angler acceptance of the new regulation has been largely positive.

Walleye broodfish collection was conducted in March resulting in few fish. Spring electrofishing for crappie is tentatively scheduled for 2021.

The lake received a stocking of 6,000 rainbow trout ( 9.2 in ) during February. The lake also received 23,040 hybrid striped bass ( 1.5 in ) in June. Under current stocking plans, hybrid striped bass will be stocked every third year instead of walleye. The walleye fingerlings for that year are set to be used for the pulse-stocking at Lake Cumberland.

The tailwater trout fishery received approximately 12,000 rainbow trout from June to November. Due to Covid19 and staffing restrictions, no trout were stocked in the tailwater during April and May. Due to an increase in temperature in the tailwater, the brown trout stocking was permanently removed beginning in 2020.

## Yatesville Lake

## Black bass

Spring diurnal electrofishing was completed in May to assess the black bass population. Length distribution and CPUE are presented in Tables 54 and 55. The lower lake produced a greater CPUE for largemouth bass versus the upper lake area (Table 54). The overall largemouth CPUE of 150.5 fish/hr was on average with the last two years and remains above the lake's historical average of $138.7 \mathrm{fish} / \mathrm{hr}$ (Table 55). The catch rate of largemouth $\geq 15.0$ in ( $13.0 \mathrm{fish} / \mathrm{hr}$ ) is slightly below the average of the last 10 years (Tables 55 and 57). Largemouth bass size structure indices were similar to previous years $(\mathrm{PSD}=42 ; \mathrm{RSD}=16$; Table 56$)$. The population assessment remained "Fair" for largemouth bass in 2020 (Table 57). Recruitment of spring age-1 largemouth has remained mostly above average since 2015. Our most recent age and growth data suggests growth is slowing (Table 57). Age and growth data collection is planned for 2021. Due to heavy angling pressure via tournaments from spring into fall, the population is watched closely. We will continue to monitor assessments.

Fall nocturnal electrofishing was completed in October to determine length frequency and year class strength of black bass species (Tables 58 and 59). Largemouth bass made up the majority of the fall sample ( $94 \%$ ) while spotted bass only made up $6 \%$. Age- 0 overall CPUE ( $53.7 \mathrm{fish} / \mathrm{hr}$ ) and age- $0 \geq 5.0$-in CPUE ( $22.0 \mathrm{fish} / \mathrm{hr}$ ) suggests that the 2020 year class was slightly below average ( $61.4 \mathrm{fish} / \mathrm{hr}$ and $33.3 \mathrm{fish} / \mathrm{hr}$, respectively; Table 59). Mean age-0 largemouth bass length ( 4.8 in ) was average compared to most years.

## Crappie

Trap netting for white crappie was conducted in mid-November (Tables 60-64). A total of 2,146 fish were collected from 3.0-15.0 in for a CPUE of 143.1 fish $/ \mathrm{nn}$ (Table 60). The assessment rating remained "Excellent"; however, recruitment of age- 0 and age- 1 white crappie has been high over the long term, especially since 2016. PSD values for white crappie sampled in 2020 (16) fell below the 2018 sample value ( 26 ; Table 61). Additionally, mean length of age-2 fish at capture decreased from 6.3 inches in 2018 to 6.0 inches in 2020 (Table 64). Consistently high recruitment appears to be keeping growth rates low (Table 64). Age-0 fish accounted for the largest year class sampled in 2020 at $36 \%$ (Table 63). White crappie will next be sampled in 2022.

Rainbow trout were stocked in the tailwater of Yatesville Lake in May (1,000 fish) and October and November (750 fish each month).

Table 1. Summary of 2020 sampling conditions by waterbody, species sampled and date.

| Water body | Species | Date | Time <br> (24hr) | Gear | Weather | Water <br> Temp <br> (ㅇF) |  | Secchi <br> (in) | Pertinent sampling comments ${ }^{\text {a,b }}$ |

## WESTERN FISHERY DISTRICT

Project 3: Technical Guidance

## FINDINGS

Table 1. Technical guidance given to pond owners in the Western Fishery District during the 2020 project year (April 1, 2020 - March 31, 2021). Approximately 85 telephone calls to the office regarding technical guidance and stocking were also handled. Additionally, numerous emails were replied to requesting farm pond technical guidance information.

| County | Date of |  |  |
| :---: | :---: | :---: | :---: |
| Pond Owner | Inspection | Findings | Management Recommendations |

Due to Covid-19 restrictions, no on-site visits were made during this project year

## NORTHWESTERN FISHERY DISTRICT

Project 3: Technical Guidance

## FINDINGS

Requests for technical guidance information were received via e-mails, phone calls, and office visits. Problems included unbalanced populations, new pond construction, stocking, fish disease and fish kills, water quality issues, aquatic vegetation control, and general pond management. Requested information was relayed via phone, e-mail, office visit, and referencing the Pond Management section of the web site. There were two on-site visits conducted in 2020, both at Fort Knox. Upper and Lower Douglas Lakes were sampled in early November at the request of local biologists.

# SOUTHWESTERN FISHERY DISTRICT 

## Project 2: Stream Fishery Surveys

## FINDINGS

Stream sampling conditions are summarized in Table 1.

## Middle Fork Drakes Creek

A selective sport fish survey was conducted mid-April using diurnal boat electrofishing on the lower 3.3 miles of Middle Fork Drakes Creek to its confluence with West Fork Drakes Creek (Table 1). Smallmouth bass were the most abundant sportfish collected (Table 2) and the smallmouth fishery rated "Excellent" (Table 3). Rock bass were well represented ( 34.4 fish $/ \mathrm{hr}$ ); ranging up to 9.0 inches in length with a population rating of "Good" (Table 4). Native stocked walleye were the third most prevalent of the sport fish collected ( $15.2 \mathrm{fish} / \mathrm{hr}$ ), despite the nearest stocking sites being 14 miles downstream and 13 miles upstream in Drakes Creek. Few sections or "holes" on the sampling stretch exceeded 7 - to 8 -feet in depth, likely aiding in fish detection and sampling efficiency.

## Drakes Creek

A fall diurnal electrofishing sample on a 1.2-mile stretch of Drakes Creek encircling Phil Moore Park was conducted during mid-October (Table 1). Spotted bass and smallmouth bass dominated this sample and received assessments of "Excellent" for the fall sample (Tables 5-7). The rock bass fishery was assessed as "Fair" based on the fall sample (Table 8). Though native walleye are stocked in this section, abundance was of no comparison ( $\mathrm{n}=3$ ) to the earlier-sampled upper site ( $\mathrm{n}=19$; Middle Fk. Drakes) in the drainage, despite only a small section of this pool exceeding 7-8 feet in depth.

## Nolin River

Nolin River below Nolin River Lake dam, was sampled during winter (Dec/Jan) and early summer (late-June) to primarily assess trout holdover (Table 1). Initial "feeler samples" from 2018 were included for additional reference as they had similar sampling metrics (flow and water clarity). Samples were conducted within these flow and water clarity target windows to aid in data consistency and comparisons across seasons. This reach of river has several pool sections that exceed 10 -ft depths, which resulted in diminished detection/collection of fish that utilize these deeper waters (walleye, sauger and black bass). Though not presented here, sport fish densities noticeably declined as flow was slowed by the influence of Green River pool \#5 and riffle areas became very infrequent.

Rainbow trout exceeding 13.0 in were noted in early summer samples, but were absent from winter samples (Table 9). Scarcity of larger fish in the winter samples suggest few fish holdover from the spring-summer stockings. Marginal water temperatures (low 70's F) characterize the late summer and early fall months and likely serve as part of the holdover bottleneck. Abundant forage (small gizzard and threadfin shad) were noted in winter samples and trout collected then were very plump. Perhaps adjusting stocking rates and timing to take advantage of the bump in forage could provide for more and larger trout in this seasonal tailwater from late winter to early summer. Though condition metrics (relative weight, etc.) were not measured, June-sampled larger fish were noted as being in poorer condition (lighter weights, with mangled fins, body scars and gashes).

The rock bass fishery was better sampled during the winter (Tables 9 and 10) with a corresponding higher assessment ranking in winter as compared to the summer sample. Occurrence and assessment of spotted bass was similar in this disparity between winter and summer samples (Tables 9 and 11). Conversely, largemouth bass densities and assessments were similar across those two seasons (Table 12). Contribution of lake fish likely explains consistency of largemouth occurrence, but not so for spotted bass, as the Nolin River Lake bass fishery is dominated by largemouth bass, with a low-density spotted bass population. Walleye occurrence was similar in summer samples across years, but different in winter samples (January, $\mathrm{n}=11$; Dec., $\mathrm{n}=3$ ). This is likely due to walleye escapement from Nolin River Lake as fall discharge events were more frequent and at higher rates than that of the December sample.

Table 1. Stream sampling conditions in the Southwestern Fisheries District in 2020.

| Waterbody | Date | Species | Water level (nearest USGS gauge) | Water temp <br> (F) | Conductivity (umhos) | Secchi <br> (in.) | Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## SOUTHWESTERN FISHERY DISTRICT

Project 3: Technical Guidance

## FINDINGS

No onsite technical guidance given during 2020 due to Covid19 restrictions. Numerous emails, phone calls, texts \& a few office visits taken, but were not enumerated.

## CENTRAL FISHERIES DISTRICT

Project 2a: Stream Fishery Surveys - Warmwater Streams

## FINDINGS

No sampling was completed on streams by the Central Fisheries District in 2020. The Streams Investigation Section did sample some streams in this district, and those results can be found in their Annual Report - F-40-43 - Statewide Fisheries Investigation Project: Subsection 1 Stream Fisheries Investigation.

# CENTRAL FISHERIES DISTRICT 

Project 2b: Trout Stream Fishery Surveys

## FINDINGS

No sampling was completed on the Dix River (Herrington Lake tailwater) in 2020. Annual weather data and tailwater flow parameters for Herrington Lake tailwater are summarized in Table 1. Data is collected from the USGS 03286200 gauge and rainfall data is collected from the USGS 03285000 gauge or National Weather Service ID (DNK2). Tailwater observations appear to have a significant relationship to the performance of trout in Dix River Tailwater. During years of high flow and rainfall, there appears to be lower than average survival of trout from year to year and in some cases eliminating the overall trout population. During years of low flow or rainfall the trout appear to flourish, and high numbers of trout will survive to the next year. Overall, this Dix River tailwater trout fishery is strongly influenced by these yearly variations of weather and water conditions.

Dix River (Herrington Lake Tailwater) was monitored for suitability for trout management (Figures 1 and 2). Water temperatures were monitored hourly at Dix River ( 2 sites) by a Hobo TidbiT MX temperature logger (MX2203) from 22 April to 1 December 2020. The results showed the average daily water temperatures in the section of the Dix River near the boat access adjacent to the shoal averaged $60.2^{\circ} \mathrm{F}\left(\min =48.6^{\circ} \mathrm{F}\right.$ and $\left.\max =68.7^{\circ} \mathrm{F}\right)$ and average daily temperatures never exceeded $72^{\circ} \mathrm{F}$ in 2020 (Figure 1). Average daily waters temperatures for the Dix River at the beginning of the trout regulation section averaged $66.3^{\circ} \mathrm{F}\left(\mathrm{min}=48.9^{\circ} \mathrm{F}\right.$ and $\left.\max =85.9^{\circ} \mathrm{F}\right)$ and the average daily temperature exceeded $72^{\circ} \mathrm{F}$ on 76 different days between 2 June and 14 September (Figure 2).

Floyd's Fork at The Parklands of the Floyd's Fork in Louisville, Kentucky was monitored for suitability for trout management (Figure 3 and 4). Water temperatures were monitored hourly at Floyd's Fork ( 2 sites) by a Hobo TidbiT MX temperature logger (MX2203) from 21 April to 2 December 2020. The results showed that water temperatures near the North Beckley Paddling Access on the Floyd's Fork averaged $67.1^{\circ} \mathrm{F}\left(\mathrm{min}=41.7^{\circ} \mathrm{F}\right.$ and max $=83.2^{\circ} \mathrm{F}$ ) and temperatures exceeded $72^{\circ} \mathrm{F}$ on 104 different days between 29 May and 15 September (Figure 3). Waters temperatures just upstream of the Echo Trail Bridge next to the Bobwhite house averaged $67.8^{\circ} \mathrm{F}$ (min $=$ $41.7^{\circ} \mathrm{F}$ and $\max =83.9^{\circ} \mathrm{F}$ ) and the temperature exceeded $72^{\circ} \mathrm{F}$ on 108 different days between 28 May and 15 September (Figure 4).

Table 1. Annual weather data and tailwater parameters for Herrington Lake Tailwater. Tailwater data is collected from USGS 03286200 gauge and rainfall data is collected from USGS 03285000 gauge or National Weather Service ID (DNK2).

| Year | Annual average <br> gauge height | Annual average <br> discharge | Days over 10 feet <br> gauge height | Annual rainfall for <br> Danville, KY |
| :--- | :---: | :---: | :---: | :---: |
| 2020 | 7.7 | 634.5 | 104 | 44.88 |
| 2019 | 7.4 | 532.1 | 86 | 39.28 |
| 2018 | 8.1 | 938.3 | 122 | 60.19 |
| 2017 | 5.8 | 364.0 | 57 | 35.15 |
| 2016 | -- | 283.6 | - | 33.57 |
| 2015 | 5.9 | 487.0 | $85^{\text {b }}$ | 42.89 |
| 2014 | a | 709.0 | a | 43.82 |
| 2013 | 7.1 | 361.8 | 53 | 64.13 |
| 2012 | 5.7 | 527.3 | 11 | 41.18 |
| 2011 | 7.3 | 52 | 61.43 |  |

Gauge heights above 10 feet have probable backwater from Kentucky River.
a In 2014, average gauge height was not recorded until August, therefore, the number of days the gauge exceeded 10 was not calculated. Additionally, gauging station was down for about 20 days during high water events.
b In 2015, the gauging station was down for 41 days during high water events.

Floyds Fork - Upstream of Echo Trail Bridge at Bobwhite House

Figure 4. Daily water temperatures observed just upstream of Echo Trail Bridge adjacent to the Bobwhite House in the lower reach of the trout section on the Floyd's Fork from 21 April to 2 December 2020.

## CENTRAL FISHERIES DISTRICT

## Project 3: Technical Guidance

## FINDINGS

A total of 29 pond owners and 39 ponds were visited in 2020. Most common problems were unbalanced fish populations, excessive aquatic plant growth, and lack of fish cover (Table 1). During 2020, nine landowners requested a Fisheries Special Management Permit (FMP) for their ponds. Finally, a total of 345 phone calls, 264 emails, and 5 walk-in office visits concerning farm pond problems were handled this year.

Table 1. Technical guidance in the Central Fishery District in 2020.

| County | Name of lake / pond owner | Date sampled | Findings | Recommendations |
| :---: | :---: | :---: | :---: | :---: |
| Anderson <br> (6) | Kenneth Barnett | 7/31/20 | Very good panfish / crowded bass | Harvest LMB and stock BG |
|  | Thomas Brown | 7/31/20 | Crowded bass | Harvest LMB; FMP completed |
|  | Jerry Rutherford | 8/18/20 | Not accessible due to vegetation duckweed | Herbicides for aquatic plant control |
|  | John Rennels | 8/18/20 | Not accessible due to vegetation duckweed | Herbicides for aquatic plant control - FMP completed |
|  | Paul Vaughn | 8/26/20 | Good fish populations | Harvest crappie and common carp |

## NORTHEASTERN FISHERY DISTRICT

## Project 2: Streams Fishery Surveys

## Trout Stream Temperature Assessments

Temperature loggers were installed in all NEFD trout designated waters. Data collection spanned from May through November. Parched Corn, Chimney Top, and Dog Fork represent the coldest streams in the district. All three are at the upper temperature threshold for trout over-summering habitat (Table 1). Upper Dog Fork maxed out at 68 degrees, making it the most suitable for trout in the district.

## Trout Stream Usage (Camera Monitoring)

Trail cameras were placed on streams to assess the number of anglers using the trout-stocked waters. Cameras were installed early August and maintained throughout the year. Middle Fork Red River received the most anglers in 2020 (Table 2).

Table 1. Monthly breakdown of minimum, average, and maximum temperatures on designated trout streams.

## NORTHEASTERN FISHERY DISTRICT

## Project 3: Technical Guidance

## FINDINGS

On site visits were suspended for 2020 due to Covid19. Consultations were handled via telephone (100125 ) and/or written correspondence ( 20 ). Most vegetation problems and a few population problems were resolved using email pictures, pond harvest log data or the use of the "Managing Your Farm Ponds" web page. Typical problems responded to included: pond stocking, aquatic vegetation problems, undesirable species, fishing information, fish kills, farm pond management, fish pathogens, water quality, pond construction, structural problems with dams, and pond nuisances.

# SOUTHEASTERN FISHERY DISTRICT 

Project 2: Stream Fishery Surveys - Trout Streams

## FINDINGS

HOBO MX TidbiT 400 (MX2203) temperature data loggers were deployed in War Fork Creek, Right Fork Buffalo Creek, and Goose Creek, to evaluate current trout management strategies. Data loggers were deployed at one upstream and one downstream location within each of the three streams and water temperatures ( ${ }^{\circ} \mathrm{F}$ ) were recorded hourly from early-May to early-November. All six temperature data loggers were visually inspected to verify condition and continued submersion on July 30, 2020. Trout stream information for each of these streams can be found in Table 1.

The upstream location of War Fork Creek recorded a low number of days (23) with daily average temperatures equal to or exceeding $72^{\circ} \mathrm{F}$, a maximum average daily temperature of $74.7^{\circ} \mathrm{F}$ between June and September, a maximum average daily temperature of $68.5^{\circ} \mathrm{F}$ during June, and zero days with an average temperature equal to or exceeding $73^{\circ} \mathrm{F}$ during June. The downstream location recorded a low number of days (6) with daily average temperatures exceeding $72^{\circ} \mathrm{F}$, a maximum average daily temperature of $72.8^{\circ} \mathrm{F}$ between June and September, a maximum average daily temperature of $66.3^{\circ} \mathrm{F}$ during June, and zero days with an average temperature equal to or exceeding $73^{\circ} \mathrm{F}$ during June (Table 2). Water temperatures in the lower portion of War Fork Creek may be the result of an influx of cooler water from a small spring located by Turkey Foot Campground.

The upstream location of Right Fork Buffalo Creek recorded a significant number of days (55) with daily average temperatures equal to or exceeding $72^{\circ} \mathrm{F}$, a maximum average daily temperature of $77.6^{\circ} \mathrm{F}$ between June and September, a maximum average daily temperature of $71.6^{\circ} \mathrm{F}$ during June, and zero days with an average temperature equal to or exceeding $73^{\circ} \mathrm{F}$ during June. The downstream location recorded a significant number of days (62) with daily average temperatures equal to or exceeding $72^{\circ} \mathrm{F}$, a maximum average daily temperature of $77.9^{\circ} \mathrm{F}$ between June and September, a maximum average daily temperature of $72.1^{\circ} \mathrm{F}$ during June, and zero days with an average temperature equal to or exceeding $73^{\circ} \mathrm{F}$ during June (Table 3).

The upstream location of Goose Creek recorded a significant number of days (71) with daily average temperatures equal to or exceeding $72^{\circ} \mathrm{F}$, a maximum average daily temperature of $77.9^{\circ} \mathrm{F}$ between June and September, a maximum average daily temperature of $74.8^{\circ} \mathrm{F}$ during June, and three days with an average temperature equal to or exceeding $73^{\circ} \mathrm{F}$ during June. The downstream location recorded a significant number of days (80) with daily average temperatures equal to or exceeding $72^{\circ} \mathrm{F}$, a maximum average daily temperature of $79.1^{\circ} \mathrm{F}$ between June and September, a maximum daily average temperature of $75.3^{\circ} \mathrm{F}$ during June, and six days with an average temperature equal to or exceeding $73^{\circ} \mathrm{F}$ during June (Table 4).

As outlined in the 2020 Trout Streams Program in Kentucky (found on the Kentucky Department of Fish and Wildlife Resources website), trout streams are currently classified as Class I, II, III, and IV streams based on four water temperature parameters: 1) the number of days stream temperatures average above $72^{\circ} \mathrm{F}$ in a calendar year, 2) maximum temperature reached in the period June-September, 3) number of days stream temperatures average equal to or above $73^{\circ} \mathrm{F}$ in the month of June, and 4) maximum stream temperatures in the month of June. Class I streams have a minimal number of days (<5) above $72^{\circ} \mathrm{F}$ in a calendar year and have a maximum temperature that remains below $72^{\circ} \mathrm{F}$ during the period June-September. Class II streams have a low number of days $(<25)$ above $72^{\circ} \mathrm{F}$ in a calendar year and have a maximum temperature that remains below $75^{\circ} \mathrm{F}$ for the period JuneSeptember. Class III and Class IV streams have a significant number of days ( $>25$ ) above $72^{\circ} \mathrm{F}$ in a calendar year and most likely will be unable to provide significant carry-over to the next year. Separation of Class III and IV streams is based on the number of days the stream temperatures remain equal to or greater than $73^{\circ} \mathrm{F}$ in June and the maximum stream temperature in June. Streams categorized as Class III streams have the potential to be stocked in June while Class IV streams are considered too warm to be stocked in June.

Based on these four water temperature parameters, War Fork Creek is classified as a Class II trout stream, Right Fork Buffalo Creek is classified as a Class III trout stream, and Goose Creek is classified as a Class IV trout
stream (Table 5). Changes to current management strategies for each of these streams are not recommended at this time.

Table 1. Southeastern Fisheries District trout stream information.

| Stream name | County | Miles of trout <br> fishing water | Location of trout fishery | Type of trout fishery | Stocking schedule |
| :--- | :---: | :---: | :---: | :---: | :---: |
| War Fork Creek | Jackson | 1.1 | Turkey Foot Recreation Area <br> upstream to Steer Fork | Rainbow Trout put-and-take | March-June, October |
| Right Fork <br> Buffalo Creek | Owsley | 0.2 | Mile 1.9-2.1 | Rainbow Trout put-and-take | April, May |
| Goose Creek | Casey | 1.2 | Mile 4.2-5.4 | Rainbow Trout put-and-take | April, May |

## SOUTHEASTERN FISHERY DISTRICT

## Project 3: Technical Guidance

## FINDINGS

Onsite technical guidance was not provided due to Covid19 restrictions. Technical guidance requests were handled over the telephone, text, or by written correspondence. Topics encountered and responded to included: fish population balance, aquatic vegetation problems, fish stocking information, water quality problems, and fish disease.

Several other requests for information (approximately 200) about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone and email.

# EASTERN FISHERY DISTRICT 

Project 2: Stream Surveys

## FINDINGS

## Trout Stream Assessments

Two streams in the trout stocking program were evaluated. Greasy Creek (Leslie County) and Looney Creek (Harlan County). Streams were monitored with in-stream devices that recorded water temperature ( ${ }^{\circ} \mathrm{F}$ ) once every hour from 13 May - 6 November for Greasy Creek and 13 May - 5 October for Looney Creek. Two sites were monitored in each stream; however, the lower stream temperature logger for Looney Creek could not be activated to remove and observe recorded data from it.

All stream sites had supporting temperatures for trout during spring and fall time periods. Recorded minimum and maximum temperature ranges are displayed in Tables 1 and 2 and were monitored in the vicinity of stocking locations. The trout management plans are different for each stream.

Greasy Creek is managed as a put-take fishery for rainbow trout (spring and fall stockings). Rainbow trout are stocked in April (400 fish) and November (500 fish). Data obtained in Table 1 supports spring and fall stocking and the trout management program could continue on as currently set. The current stocking location is near the downstream site of recorded temperature data. This site can continue to be used as the primary stocking location.

Rainbow trout are stocked at a rate of 500 fish each month in April, May and October. Brown trout are stocked in April (700 fish). Rainbow and brown trout are managed under statewide limits. Due to this stream having a year-round $60^{\circ} \mathrm{F}$ input of water from a coal mine portal at Lynch, KY, there is an acceptable number of trout surviving throughout the year. Due to some fish in angler catches reaching 20.0 in or greater, and brown trout managed under a 16.0 -in length limit, the stream is viewed as put-grow-take for both rainbow and brown trout. Recorded water temperatures shown in Table 2 support this management option.

Table 1. Temperature data from Greasy Creek, Leslie County, Kentucky (13 May - 6 November 2020).

## EASTERN FISHERY DISTRICT

Project 3: Technical Guidance

## FINDINGS

Details of technical guidance provided during 2020 are shown in Table 1. On-site technical guidance was provided for two ponds. Additional technical guidance requests were handled over the telephone, walk-in visits, or by written correspondence. Topics encountered and responded to included: fish population balance, water quality problems, fish stocking, fish disease, and aquatic vegetation problems.

Several other requests for information about area fisheries and miscellaneous information about fish management in lakes and ponds were handled over the telephone, email, and walk-in visits.

Table 1. Pond technical guidance in the Eastern Fishery District during 2020.

| Date | County | Owner | Problem | Recommendations |
| :---: | :---: | :---: | :---: | :---: |
| 01/28 | Owsley | J. Kramer | Stocking Info. | Web site links: pond book, fish supplier list, consultation |
| 2/27 | Law rence | John Arthur | Pond balance, Stocking info | Pond in good condition, do not stock, continue to observe |
| 3/18 | Floyd | Travis Hall | catfish disease | provided pictures |
| *4/1 | Floyd | Travis Hall | Catfish with lesions | Treat with copper sulfate every 3 days, 4-5 treatments |
| 4/2 | Law rence | Curt Fitzpatrick | Stocking info (RESF, hybrid bluegill) | Recommend RESF for pond |
| 4/15 | Law rence | John Collins | Re-stocking procedures | Drain pond to kill existing fish first |
| 5/12 | Knott | Dexter Conley | Bass spaw ning and recruitment | Add habitat (cedar trees, pallets) |
| 6/1 | Pike | Harold Sanders | Filamentous algae | algaecide treatment (cupper sulfate, Cutrine Plus) |
| 6/2 | Johnson | Tina Jude | Acid mine w ater in pond killing fish | Add lime and/or evaluate cost investment long term |
| 6/3 | Johnson | James Davis | Filamentous algae | Algaecide treatment (Cutrine Plus) |
| 6/5 | Johnson | Samuel Slusher | Stocking questons | Call back |
| 6/8 | Law rence | Curt Fitzpatrick | Vegetation (floating leaf pondw eed) | Herbicide - Weedtrine D or Aquathol K |
| 6/15 | Letcher | Jeffrey Hampton | Fish kill | Pond turn-over |
| 6/18 | Knott | Shane Ambergy | Fish stocking and transoprting | Aeration and satl rates |
| *6/22 | Letcher | Chad Morgan | Pond balance, vegetation | Harvest 12-13" bass, Stock BG/RESF, grass carp |
| 6/22 | Leslie | Wayne Engle | Pond balance, Stocking info | Maintain fishing log, stock catfish |
| 7/21 | Law rence | Kathy Crisp | Naiad control | Cutrine Plus + Weedtrine D, fertilize next spring |
| 7/22 | Magoffin | Perry Arnet | Black spot parasite, brown algae | Cook fish w ell, Cutrine Plus |
| 8/17 | Law rence | Gordon Crisp | Pond balance, bass/sunfish sizes | Harvest smaller bass and large channel catfish |
| 8/18 | Perry | J. Deaton | Duckw eed, algae, grass carp | Weedtrone D + Cutrine Plus, Grass carp 3 / 4 per acre |
| 8/25 |  | Gary Endicott | minnow production | Wood pallets |
| 9/1 | Knott | J. Slone | Grass carp stocking | Fish supplier list |
| 10/29 | Perry | Steve Campbell | Pond stocking questions | Provided info from Jones Hatchery |
